NETWORK

WHITE PAPER

PRIVATIX.IO

Internet Broadband Marketplace powered by VPN Network on Blockchain

WHITE PAPER

March 2018

Release 6.0 - English

Abstract

This white paper presents the Privatix concept of a decentralized autonomous VPN network on blockchain with its own crypto-economy which will serve as the first bandwidth exchange marketplace. Based on the blockchain technology, the network will contain thousands or even millions of exit nodes around the world and will provide an innovative new way for developers to build products that will potentially disrupt several markets, like the consumer VPN industry, cyber protection, CDN, business intelligence and even software and mobile apps monetization.

1. Introduction

Privatix is an established and profitable company that was founded by a group of experienced IT entrepreneurs and talented developers who are passionate about the freedom of the internet, online security, and the rights of individuals and businesses to privacy protection.

Our team - which has more than 10 years' cyber security experience - are the developers of an incredibly easy-to-use, free VPN service - at Privatix.com - that can be used by anyone anywhere, regardless of their level of technical experience. Since 2015, more than 1,250,000 users have used this service.

Privatix is also the team behind Temp-Mail.org. It has more than 200,000 daily visitors and filters out more than 10 million spam emails a day.

Privatix has developed the advanced internet identity checking website Ipleak.com, and many other privacy-related services.

Now we have created a concept of a decentralized, fully autonomous network on blockchain. The Privatix Network is designed to have its own advanced crypto-economy and allow the users to rent out their broadband. We believe it has the potential to end the current era of internet censorship and totally change the current VPN market, among others (e.g. cyber security).

1.1 Major problems facing the internet

The incredible worldwide growth of internet users is astounding. In 2016 we had 3.4 billion users, representing 46% of the world's population. By 2020, it is predicted that we will see 5 billion users online.

But, as the number of users online grows, so does the level of internet censorship. In the future, most new users will likely come from countries with increasingly strict internet censorship laws; because these users often have poor internet mobile connections, they are the most vulnerable to these sometimes draconian and arbitrary laws. It is these users who are seeking effective solutions to internet restrictions.

Today, one of the major problems with the internet is the denial of the network neutrality paradigm, that suggests an equal opportunity for everyone to access the world wide web.

This denial will lead to the collapse of the internet as we have known it over the last 25 years. Users are not just being watched by overzealous governments and cybercriminals, their data is collected by ISPs and their basic privacy rights are routinely violated. This is happening not just in countries like China or Iran, but in Australia, Germany, and even the U.S.

The second problem is the cybersecurity issue. According to Cybersecurity Ventures report, we have more than \$3B in losses from cybersecurity incidents online in 2015 and it is expected to grow to \$6B in 2021. The complexity of technical solutions today means that robust encryption algorithms aren't always accessible to ordinary people to effectively protect their data and ensure cybersecurity easily and affordably.

The third problem is speed. While the internet is global, network quality is not equal in all countries. Content is getting heavier all the time, e.g. full HD videos, streaming movies, etc.

1.2 The current centralized solution

Solutions for the internet censorship problem are currently available on the market. However, they come with a high price tag and are still vulnerable to ISPs control. It's not a secret that the VPN industry is growing fast, not least of all because of the lure of the industry's huge profit margins. As an insider, Privatix is aware of some of the major problems in the centralized VPN

arena, including false statements about log-keeping policies, data selling, overcharging, unclear billing policies, and the incredible margins that are siphoned off into marketing, advertising, etc.

In fact, the VPN industry doesn't protect users' privacy and data while the users pay a high price for VPN services only because there are no better options on the market.

1.3 New opportunities

With its huge potential to be one of the most powerful forces in the internet technologies sphere, blockchain will enable us to turn current internet privacy and security practices on its head, simultaneously speeding up the internet (without any physical scaling.)

Privatix Network is a conceptual new solution that will benefit ordinary internet users, developers, and online businesses. We intend to reduce costs and margins on the VPN consumer market, eliminate the middleman and enable people to share (and profit from sharing) their spare broadband connection. We will provide a new horizon for developers to build awesome apps and services on the basis of this network, e.g. CDN, business intelligence proxy tools, anti-censorship SDKs for apps, etc. The wealth of potential applications is only limited by imagination.

1.4 Our mission and goals

Our mission is to create a decentralized and fully autonomous VPN Network on blockchain with advanced Internet bandwidth marketplace powered by its own crypto-economy.

Our goal is to show a possibility to create new kinds of products and services based on the Network capabilities which have the potential to transform a number of markets like VPN, CDN, cyber security and encryption or may even change the landscape of application monetization market.

2. Token PRIX

The Privatix Network ecosystem will be based on crypto-economic principles. PRIX will be the only crypto-currency allowed for mutual settlements during the buying / selling interactions between network participants.

2.1 Specifications

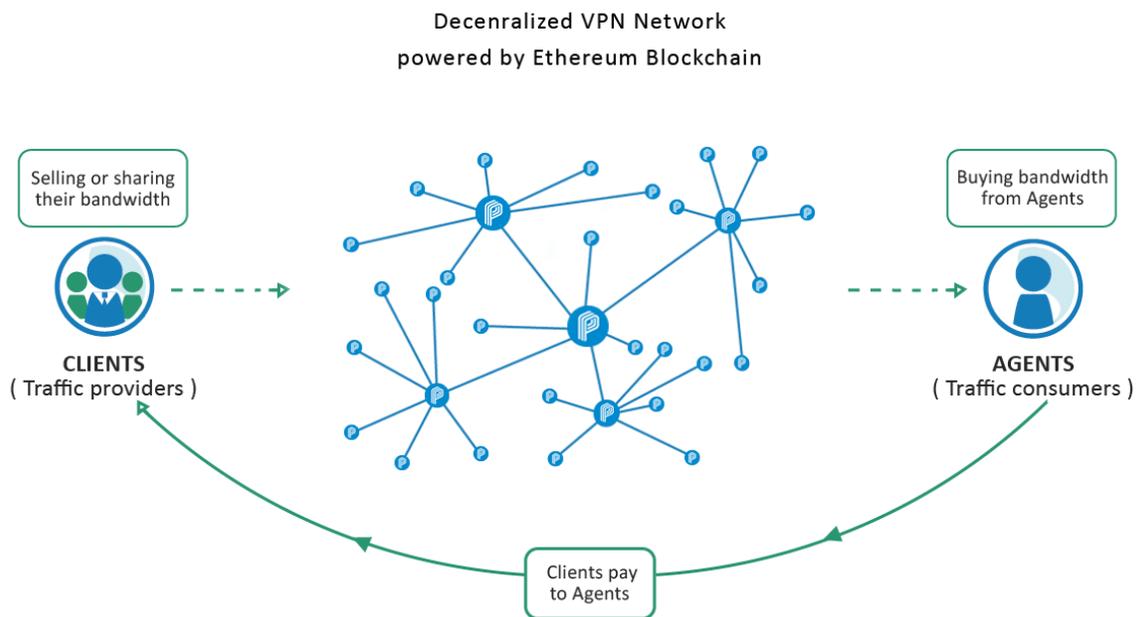

PRIX, an ERC20 token on the Ethereum Blockchain, is the central part of the Privatix Network. It's main purpose is to allow network participants to exchange value.

Token name	Privatix Token
Ticker	PRIX
Type	ERC20 (Ethereum)
Address	0x3adfc4999f77d04c8341bac5f3a76f58dff5b37a
Decimals	8
Total supply (after burning)	1,275,455 PRIX (fixed, no dilution)
Mining	No mining or any other means of increasing token amounts will apply to Privatix Token
Token utility	Internal crypto-currency to exchange value (utility) between Privatix Network participants
Token issuer	Privatix Token Ltd (a Gibraltar limited company)
Token special conditions	Token exchanges for purpose of buying / selling internet broadband (between Privatix Network participants only) will be subject to commission fee - up to 1% of transaction price in PRIX. No fees for any other transactions and exchanges except payments for bandwidth.

2.2 The crypto-economy

The main economic agents inside the crypto-economy of the Privatix Network are:

- Users who want to sell their internet bandwidth (Agents)
- Users who want to buy internet bandwidth from Agents (Clients)

PRIX will be the only crypto-currency allowed for mutual settlements. At the same time, the PRIX token itself is expected to be traded on external exchanges. Assuming there is sufficient market volume, PRIX shall be freely exchangeable for other cryptocurrencies in both directions and anytime, subject to applicable regulations and/or restrictions in the various jurisdictions.

PRIX is not intended to be a digital currency, security, commodity, bond, debt instrument or any kind of financial instrument or investment carrying equivalent rights, nor are the PRIX tokens intended to represent any form of money or legal tender in any jurisdiction, nor any representation of money (including electronic money). Accordingly, any protections offered by

applicable law in relation to the purchase, holding and/or sale of the instruments and/or investments referred to above and generally known as “securities”, should not apply to your holding or sale of PRIX tokens. PRIX tokens are intended to be digital goods, similar to downloadable software, digital music, and etc.

In basic economic terms, on the demand side there are Clients and on the supply side there are Agents. Clients want to buy broadband from Agents, and Agents, accordingly, want to sell it. So, at the market equilibrium point, the price of internet broadband will be represented in PRIX tokens (for example, 1 MB = 0.001 PRIX).

In the event of an excessive demand for Agents' broadband, the PRIX token is going to increase in price, thereby likely to attract more Agents to the network (as they will see they can sell their broadband for a higher price) and vice versa.

Demand and supply will be self-regulated effectively by market forces; attracted in the case of high traffic costs by Agents craving profit, and in the case of low traffic cost by Clients wishing to buy broadband as cheaply as possible.

2.3 Examples of use

Here are two very simple examples which demonstrate PRIX tokens payments inside the Privatix Network ecosystem.

Example 1

- Hans, a regular internet user from Germany, has a 100 Mbps channel and he does not use it completely, especially at night.
- He has already paid his ISP so no additional costs are required.
- Hans installs the Privatix Network software and thereby becomes an Agent.
- On the other side of the world is a Chinese internet user, Lee.

- Lee does not have access to many internet sites because internet censorship in China is very strict.
- Lee installs a VPN program based on the Privatix Network and through it buys broadband from Hans. Now he can surf the internet via the encrypted German VPN and get access to all internet sites.
- Hans receives payment in PRIX as Lee uses his free bandwidth.

Example 2

- Alex has an internet hosting business. He rents 10 dedicated servers and sells hosting services for his customers, e.g. site owners.
- All servers are already paid for but their bandwidth is significantly underused.
- Alex installs the Privatix Network Agent software on all his servers and starts selling his bandwidth.
- Another user, Ivan, the owner of a video site, has to rent expensive servers so that people can watch HD video content from around the world.
- Ivan, in order to save on data transfer, uses a product based on the Privatix Network - a CDN - which allows him to buy cheap broadband from hundreds of Agents like Alex.
- As a result, Alex fully loads his servers and receives profit while Ivan cuts content delivery costs.

3. Token sale

The Privatix Token Sale opened on 19 October 2017 and ended at 16 November 2017. During those 30 days we collected: 5,775 ETH (7,183 ETH in total with 1,408 ETH of Pre-sale).

3.1 Privatix Token (PRIX) final distribution details

100% Total supply: 1,275,455

83% Token Sale and Pre-sale: 1,058,627

7% Founders (locked for 12m): 89,281

7% Future and current team: 89,281

3% Advisors, bounty, and cost covering: 38,263

Total circulation supply: 1,058,627 (7% of locked 12m tokens excluded)

Total contributors: 1,435

All unsold tokens were burned, and no future tokens can be issued.

The exact total supply is 1,275,455.31177803 PRIX

Token address: 0x3adfc4999f77d04c8341bac5f3a76f58dff5b37a

4. Business model

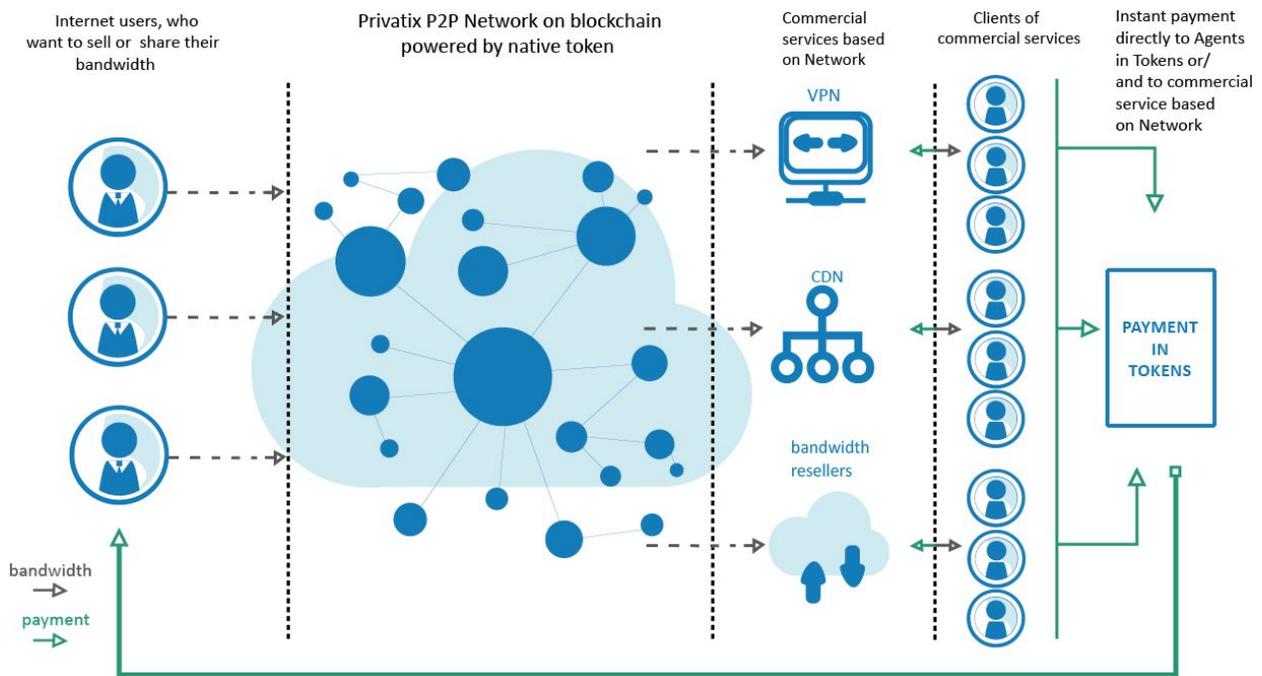

The main assets in the Privatix Network are “exit nodes owners” (Agents). These Agents host on their internet-connected devices special lightweight software which enables them to sell their internet bandwidth.

Most internet-connected users have a lot of spare bandwidth that already has been paid for to an ISP but mostly remain unused.

Privatix will enable the sale of this unused asset (bandwidth) to other network participants and strives to create meaningful value for Agents with no additional costs or any initial investment from their side (installing the free software is quick and easy).

All financial relationships between Agents and Clients will be in PRIX crypto-currency only. Every token exchange linked to payment for internet broadband will be subject to a fee that will be accumulated by Privatix for maintenance and future development. The fee will be in the range up to 1% of the transaction amount. All operations except payments for internet bandwidth, like token trades on exchanges, will be free from any fees.

4.1 Privatix Network

4.2 Proof of Concept (PoC) products

Our mission is to create a decentralized and fully autonomous network on blockchain - the Privatix Network – but, hand in hand with this, one of our primary goals is to show how people can make the best use of this network and benefit from it in many different ways, including financially.

For this reason, we ourselves will create a number of revolutionary PoC products, based on the Privatix Network, in order to demonstrate to entrepreneurs and developers how they can use this new platform in a number of innovative ways. Privatix, as platform pioneer, also has the potential to derive significant profits from these products by transforming several popular VPN and other markets (e.g. cyber security).

The first product we will focus on will be a decentralized unblockable VPN on blockchain that we believe will address the challenges facing cybersecurity and internet censorship in the digital sphere forever. We expect to totally change the consumer VPN market, enabling people to use VPN for free by sharing their own network, or pay less than \$5-10 per year (10-20 times less than current centralized VPN prices).

4.3 Long-term strategy

We define the long-term strategy as a plan for the next three years. In the current real-world situation of internet disruption and blockchain technologies development, it is a challenge to create a fully detailed plan, but by sticking to our mission and goals, and relying on our extensive experience, we are completely confident that we will find the right way in any situation.

Facilitation of a Privatix Network platform, provision of network supply in the form of Agents, as well as the creation of demand in the form of Clients are our main objectives for the immediate future.

The challenge we face will be to facilitate a balanced marketplace: we will address this by providing adequate compensation to Agents and at the same time create demand by customers. Initially, we will take on the roles of customers and PoC products' owners. We will use our funds to promote the network and ensure its growth and maintain the optimum balance between supply and demand.

At this time we predict the network will include tens of thousands or even millions of Agents. By developing a variety of products based on its foundations, the network will start taking on a life of its own. Privatix will benefit only from the network token exchanges fee and will develop the infrastructure of the network and products.

5. Technical specifications

Specify high-level solution description for Privatix.io services. This document describe high level architectural and process overview of Privatix.io service.

5.1 General

[Privatix.io](#) attempts to deliver multiple services that can be used through Privatix network. First of them is decentralized VPN service on Ethereum blockchain. This paper will focus on VPN service. Before we will dig in to details, of how Privatix services will operate, we need to mention some basic concepts.

Privatix network users

Clients - those who consume and pay for services.

Agents - those who provide services and receive payment.

Concept

The idea that stands behind this project is to create process that will achieve consensus among Privatix network users and develop software products that will allow users to provide and consume services on this network. Another important aspect that those processes should be decentralized as much as possible, to remove single point of failure both technically and politically. Last major goal is to protect privacy of users.

5.2 Basic usage scenario

To allow Privatix network users to provide and consume services they need to:

- Create service offering
- Find service offering, compare and accept it
- Be sure that they can pay and get paid
- Negotiate on authentication and find service endpoint
- Provide and consume service
- Pay and get paid in small portions

Below we will describe each process, including some technical description.

5.3 Prerequisites

We assume that each network user has:

1. Internet access
2. PRIX tokens with corresponding private keys
3. Agent - have installed Privatix Agent software
4. Client - have installed Privatix Client software

5.4 Smart contract operations

Ethereum smart contracts playing fundamental role in Privatix DApp architecture. Currently deployed smart contract that holds all PRIX tokens called Privatix Token Contact (hereinafter PTC) and compliant with ERC20 standard.

PTC will be used for:

- Token exchange
- Upgrade to new service contract

To provide additional logic and features, as well as support future upgrades, Privatix will deploy additional smart contract named Privatix Service Contract (hereinafter PSC). PSC contract implements state channels features, service offering discovery, helps to negotiate on service setup, incentivize fair usage and controls supply visibility. Token exchange between Ethereum accounts is done using standard ERC20 transfer mechanism. PTC balances will be used to buy and sell PRIX only, rather than pay for services. To use Privatix services PRIX tokens will be approved for transfer to PSC contract address effectively delegating all operations to PSC contract.

PSC will be used for:

- Local balance storage
- Agent SO registration and deposit placement
- Agent SO deactivation and deposit return
- Retrieving available supply for SO
- Pop up SO
- Creating state channel
- Cooperative close of channel
- Uncooperative close of channel
- Top up deposit of state channel

State channel performance

To save Ethereum gas and decrease time, which is required to setup state channel, PSC will maintain its own balance mapping. This mapping will hold mapping of PRIX to user's balances until user will decide to move PRIX balance back to PTC. For that purpose, PSC will have mechanism to return back tokens from PSC to user's Ethereum address in PTC. Making PSC operations rely on internal balances greatly improves security by preventing external contracts to execute arbitrary code thus mitigating reentrancy attacks.

Smart contract upgrade

To support future upgrade of PSC logic and features, while giving users ability to control and audit such changes, following upgrade path is planned. Privatix Company may publish new version of PSC (e.g. version 2.0) in future. Users would verify smart contract code and if agreed, that it is safe to use, will firstly transfer their PRIX tokens from PSC v1.0 back to PTC and only then to PSC v2.0. Such approach leaves no backdoors even for Privatix employees and gives anybody ability to review new smart contract code before they switch to it. Privatix company may implement PSC.upgrade() function, which can be executed only by Privatix company. This function will prevent incoming transactions from PTC to PSC, but will still allow transfer of balances back to PTC. This method can be used as notification of smart contract upgrade to users UI, as well as pushes users to perform upgrade.

Service supply

Service supply is maximum number of concurrent Clients that Agent can serve with same SO parameters. When Agent registers his offering in PSC, he will specify service supply. Publishing service supply will allow Clients to find out, if Agent still has available supply to serve the Client according to published SO. Before state channel is created, PSC will check, if available supply still exists and keep demand and supply balanced. After state channel was created PSC will emit event with actual service supply, making possible for all users to filter out offerings with zero supply. If state channel is closed, service supply will be increased and users notified.

Sybil attack mitigation

Sybil attacks mitigation in decentralized networks, where at least some degree of anonymity expected is not obvious. We are not informed on any bulletproof technology to mitigate Sybil attack completely and without introducing some entrance threshold. Most used techniques today are proof of work, proof of stake, one-time fee, IPv4 address binding.

Malicious Agent

To maintain network health and incentivize fair usage, we will require Agents to register their service offering in Ethereum blockchain and place deposit. This deposit can be returned back after some challenge period is passed from last operation with this SO. This step should protect Privatix network from easily being overwhelmed with junk SO and make Sybil attack less efficient. Agent Deposit should be proportional to service supply. If malicious Agent will place useless SO, that he never goes to fulfill, he will be required to place exactly same deposit as Client will place to accept this offer. On the other hand as time passes from service offering registration, Clients will more likely to consider that this SO is irrelevant and will not accept this offer. Agent will need to notify Clients from time to time that his offer is still alive by popping up it. When Agent pop-ups his SO, deposit will be locked once more for the same challenge period. As pop-up operation makes it cheaper for Agent to spoil service offerings, Clients will make additional consideration before accepting such offer. Long running SO can be easily rated by comparing number of cooperative channel closes with uncooperative. If Client created state channel, but did not receive any service he will be forced to make uncooperative channel close. In that case, blockchain event will be emitted where Agent address is listed. If Client will see that there is too many uncooperative closes compared to cooperative once, he will not create new state channel with this agent. This will require malicious Agent to create new Agent address, transfer tokens and register new service offering. Such malicious operation is expensive and not effective.

If Agent will try to act both as Agent and Client to increase number of cooperative closes, it will cost him additional transaction fees. Moreover, each time he will act as Client he will reduce available supply for his service offering. In this case, he need to occupy at least half of maximum supply to make number of cooperative closes equal to number of uncooperative closes. This force him to place $x 1.5$ deposit than locked by normal Clients and still his reputation is far from being perfect.

We can summarize that Sybil attack by Agent is limited with Agent token balance, by challenge period and burns Ether with transaction cost.

Malicious Client

To harm Agent's reputation malicious Client can create state channel and will not send balance proofs to Agent. When creating channel, Client is required to place deposit, which is locked for challenge period. To return deposit back to his balance he need to close the channel. Both operations burns Ether with transaction cost. Agent can also check blockchain event for uncooperative closes of channel made Client and rate him accordingly. This limits effectiveness of attack.

Reputation

Both Client and Agent communication results in cooperative or uncooperative channel close. Each time blockchain event is generated which includes address of Client and Agent, participating in channel transaction. These events can be used to make decisions about user reputation. User can not only count number of cooperative vs uncooperative closes for another user, but also go deeper and build reputation based on transactions of observed user's partners. For example, if Agent want to decide on Client's reputation he can see that this Client had good transactions with other Agents and then check those Agent's transactions and see their transactions, etc.

Summary

Even these measures still does not prevent 100% of Sybil attacks; it definitely limits probability and effectiveness of them both for Clients and Agents.

5.5 Service offering flow description

Before Client and Agent can use Privatix services, they need to by PRIX tokens and transfer them to PSC (Privatix Service Contract).

Service discovery and setup overview

Before service can be used, Client should:

- discover service offering
- agree
- put deposit

- specify authentication secret (password)
- get service connection endpoint

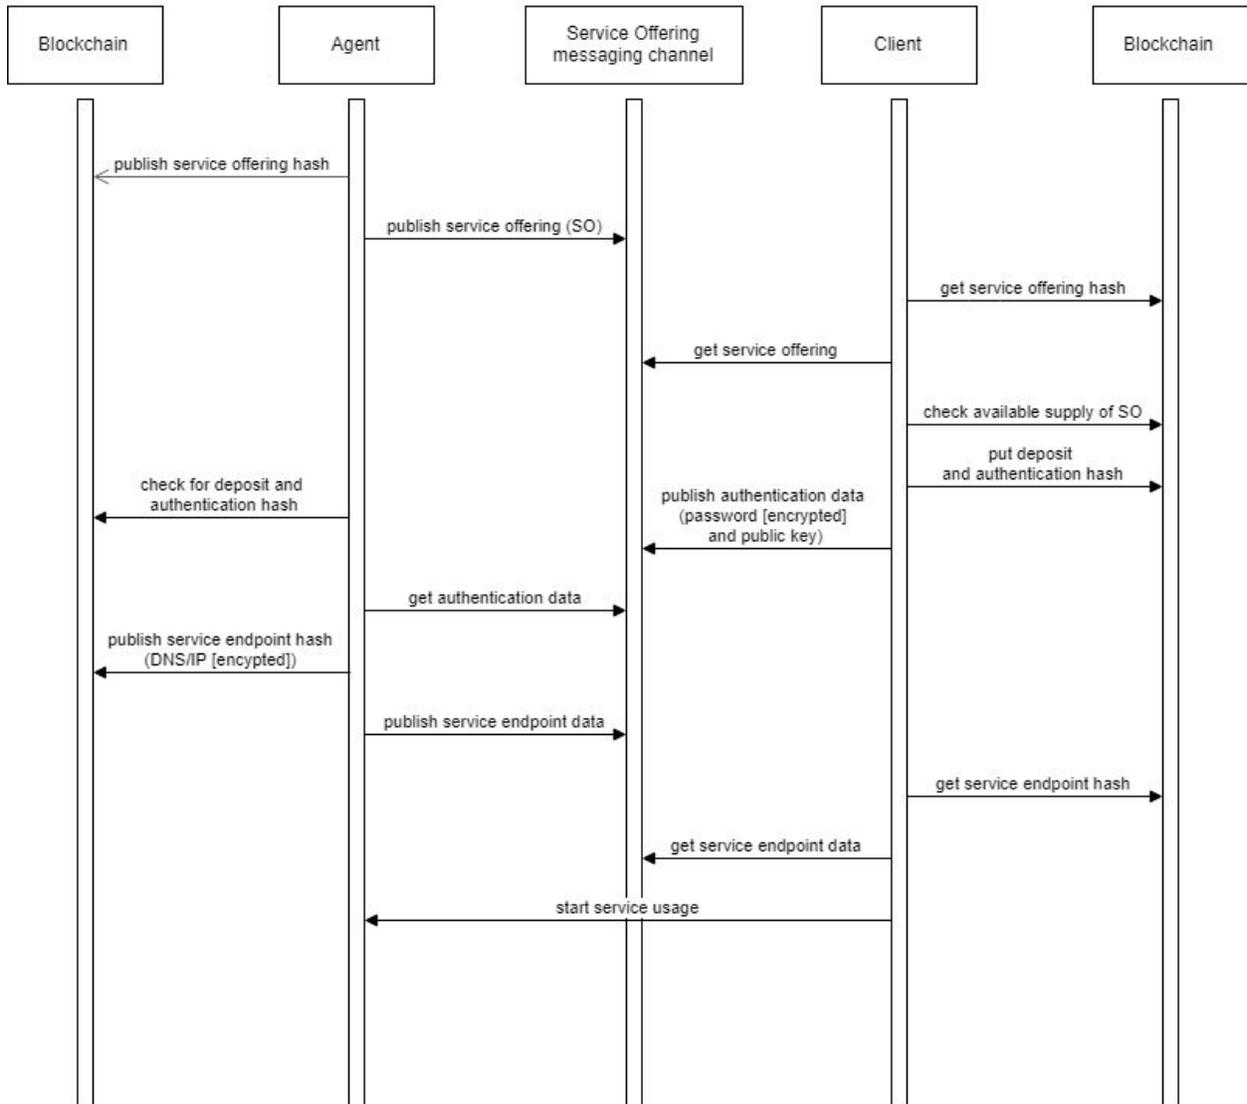

This mechanism is implemented via some sort of messaging between Client and Agent. Medium for such communication includes blockchain and offering messaging channel. Offering messaging channel is currently implemented as web-service, which allows Clients and Agents to publish and retrieve data. Privatix Company will attempt to make a fully decentralized solution by removing this single centralized component.

Service offering messaging description

Service offering messaging diagram shows sequence of communication between Client and Agent through Offering Messaging Channel and Blockchain. This process allows publishing and discovering service offering details, securely setup password and securely providing endpoint address.

Operations with blockchain cannot be perfectly sequenced and require multiple checks to ensure that state is stored in blockchain with desired degree of probability, which increases exponentially with number of mined blocks.

Service offering messaging

Service offering messaging diagram shows sequence of communication between Client and Agent through Offering Messaging Channel and Blockchain. This process allows to publish and discover service offering details, securely setup password and securely provide endpoint address.

Note: Operations with blockchain cannot be perfectly sequenced and require multiple checks to ensure that state is stored in blockchain with desired degree of probability, which increases exponentially with number of mined blocks.

Publish Service Offering

Prepare Service offering

Each Agent node may be located in different geographical location, has different internet bandwidth and has different cost for internet access. For these and others reasons service parameters, TCO and as a result, price may be different on the market. We want to give a freedom for each Agent to decide on his pricing and service policy. On the other hand, we want each Client to be able to understand these offerings and be able to compare among them. To achieve this we will define template for service offering, which will include essential service parameters. Along with service and billing parameters, service offering (hereinafter SO) contains additional fields, which allows to verify integrity of SO, as well as belonging of SO to specific Agent, holding particular private key. Before publishing, SO Agent cryptographically signs and then encrypts it with his own private key.

One of essential SO fields is Agent's public key. It is used to uniquely identify Agent, encrypt messages to Agent and used by Client to send payments to this Agent. Client must always verify that SO belongs to specific Agent by checking SO signature. SO signature verification ensures that no fields in SO were altered, including Ethereum address that is used to receive payments for the service being consumed. Service offering template may change in future to support different services and additional fields. Each template will contain version field that is unique for each service. Below you can find service offering template fields for VPN service with their descriptions.

Service offering template

Field name	Field type	Field length	Description	Allow null	Example
template_version			Version of template		1
agent_public_key			Agent's public key		04a34b99f22c790c4e36b2b3c2c35a36db06226e41c692fc82b8b56ac1c540c5bd5b8dec5235a0fa8722476c7709c02559e3aa73aa03918ba2d492eea75abea235
service_name			Name of service (e.g. VPN)		VPN
country			Country of service endpoint in ISO 3166-1 alpha-2 format.		US

service_supply			Maximum supply of services according to service offerings. It represents maximum number of clients that can consume this service offering concurrently.		5
service_unit			MB/Minutes		MB
unit_price			PRIX that must be paid for unit_of_service		0.0000002
min_units			Used to calculate minimum deposit required		100
max_units			Used to specify maximum units of service that will be supplied. Can be empty.	Yes	10000
billing_interval			Specified in unit_of_service. Represent, how often Client MUST provide payment approval to Agent.		50
billing_interval_time_deviation			Time in seconds that Agent will wait for payment approval after each billing interval, before Agent will consider payment approval was not received.		10
free_intervals			Used to give free trial, by specifying how many intervals can be consumed without payment		2

min_download_mbps			Minimum expected download speed (Mbps). Can be empty.	Yes	0.2
min_upload_mbps			Minimum expected upload speed (Mbps). Can be empty.	Yes	0.5
protocol			Protocol: TCP or UDP		
uuid			Random number to allow generation of identical SO with different hash. Possibly UUID4 generated according to RFC4122.		ea864be6-db42-43e2-bffa-aa44ace573f0
signature			Cryptographic signature of SO generated using Agent's private key.		1HZwkjkeaoZfTSaJxDw6aKkxp45agDiEzN GyjfvdCnYYNVCE0plqKKrnNXkaQrbbPnD e2r59jZJSWlicL6YMi/zaH6VhykqBpQWak pHA+4fxyuiAcSzZAUK9A=

Order of fields in SO template is significant. Will conform to JSON schema format (<http://json-schema.org>). Service offering signature is generated using Ethereum typed data signing (according to <https://github.com/ethereum/EIPs/pull/712>). This signing method includes service offering template fields names and types as part of signature, thus strictly binding template format with its data. This seems a good practice, especially for integration with UI of wallets.

Service Offering message

Keccak-256 hash of SO message (aka offering hash) is used to uniquely identify service offering.

Service offering hash generation

1. Transform SO template (fields, types and data) to string compliant with Ethereum EIP712

2. Sign (1)
3. Generate keccak-256 hash of (2)

Service offering signature generation

1. Transform SO template (fields, types and data) to string compliant with Ethereum EIP712
2. Generate keccak-256 hash of string
3. Sign hash with private key

Service offering verification

1. Transform SO template (fields, types and data) to string compliant with Ethereum EIP712
2. Generate keccak-256 hash from string
3. Use `ECVerify.ecverify(_so_hash, _so_signature)` to retrieve Agent's Ethereum address
4. Get Agent's Ethereum address from Agent's public key, published in SO
5. Compare retrieved Ethereum address in (3) with address in (4)

Blockchain usage

After Agent has prepared Service Offering, Hash of SO is published in blockchain using function `PSC.registerServiceOffering (bytes32 _offering_hash,uint256 _min_deposit,uint16 _max_supply)` Along with SO hash, minimum deposit and maximum supply is specified (see Smart contract operations). Agent will check that SO has successfully stored in blockchain state by checking corresponding event

`PSC.LogServiceOfferingCreated`

Agent will query blockchain desired times to ensure that registered SO is not get to uncle block.

Offering Messaging Channel usage

After SO was successfully stored in blockchain, Agent will publish his SO through Offering Messaging Channel. He will receive response indicating that message was stored successfully.

Offering Messaging Channel will accept message only if hash of submitted message is registered in blockchain and discoverable using blockchain events:

- *LogServiceOfferingCreated*
- *LogChannelCreated*
- *LogServiceOfferingEndpoint*

Discover service offering

Blockchain usage

Client will search for actual offering by retrieving blockchain events in last defined number of blocks. This will prevent from old and unmaintained service offerings to be caught by this query (see Smart contract operations).

- LogServiceOfferingCreated
- LogServiceOfferingPoppedUp

Client may analyze reputation of service offering submitters (Agents) by observing number of cooperative and uncooperative closes that corresponds to their Ethereum address. This can be achieved by filtering blockchain events by:

- LogCooperativeChannelClose
- LogUnCooperativeChannelClose

Offering Messaging Channel usage

After filtering unsatisfactory offerings by minimum deposit and reputation, Client will download full SO data. Full SO data is retrieved from offering messaging channel (web service) by indicating hash of offering. Client will:

- verify that signature is correct
- SO is filled correctly and conforms with known SO template scheme
 - all not null fields are filled
 - order of fields is correct
 - data type correct
 - field length correct

If SO passed all verifications it will be stored in DB. If some verifications failed, it will be marked as "not well formed" and will be ignored in future.

Choosing Service Offering

UI of Client allows filtering and ordering of service offerings, getting reputation statistics for each agent and therefore giving ability to choose appropriate offering. Client will choose manually or automatically suitable offering.

Service Offering UI basic view can be seen as following:

Date published	Date popped up	Agent address	Country	Price (PRIX)	Unit	Min. Deposit (PRIX)	Supply max/available	Billing interval	Free trial	Direct rating (Uncooperative/Cooperative)	Number of transactions
11-Dec-2017	31-Dec-2017	04a3....a235	US	0.0000002	MB	0.00002	10/10	50 MB	100 MB	5%	123
11-Dec-2017	N/A	43b5....c273	IL	0.00015	minute	0.00008	5/1	10 min	20 min	N/A	0

Check for available supply

Before Client will place deposit he wants to be sure that Agent has available supply and can serve him. To check for free supply Client will query for blockchain events:

- *LogServiceOfferingDeleted*
- *LogServiceOfferingSupplyChanged*

LogServiceOfferingDeleted can indicate that SO was deactivated and thus no more relevant.

LogServiceOfferingSupplyChanged will indicate number of available service supply.

If SO still active and has available supply, Client will attempt to place deposit.

Deposit and authentication message

Prepare authentication message

Authentication message is used by Client to deliver password, which is used to authenticate him, while using the service. Password is encrypted with Agent's public key found in SO and therefore can be decrypted only by Agent. Authentication message hash is keccak-256 hash of authentication message.

Authentication message template

Filed name	Field type	Field length	Description	Allow null	Example
template_version			version of template		3
client_public_key			Client's public key		04a34b99f22c790c4e36b2b3c2c35a36db0 6226e41c692fc82b8b56ac1c540c5bd5b8d ec5235a0fa8722476c7709c02559e3aa73a a03918ba2d492eea75abea235
uuid			Random number to allow generation of identical authentication with different hash. Possibly UUID4 generated according to RFC4122.		ea864be6-db42-43e2-bffa-aa44ace573f0
password			Password encrypted with Agent's public key. Should be randomly generated and complaint to password complexity policy.		
signature			Cryptographic signature of authentication message generated using Client's private key.		1HZwkjkeaoZfTsaJxDw6aKkxp45agDiEzN GyjfvdCnYYNVCE0plqKKrnNXkaQrbbPn D e2r59jZJSWlicL6YMi/zaH6VhykqBpQWak pHA+4fxyuiAcSzZAUk9A=

Authentication message hash generation

1. Transform template (fields, types and data) to string compliant with Ethereum EIP712
2. Sign (1)
3. Generate keccak-256 hash of (2)

Authentication message signature generation

1. Transform SO template (fields, types and data) to string compliant with Ethereum EIP712
2. Generate keccak-256 hash of string
3. Sign hash with private key

Blockchain usage

Client will attempt to create state channel (see Smart contract operations). Along with state channel creation, Client will specify authentication message hash. Client will check for blockchain event *LogChannelCreated*, which will indicate successful creation of state channel.

Offering Messaging Channel usage

After state channel was successfully created, Client will publish authentication message to offering messaging channel.

New subscriptions discovery and account setup

Blockchain usage

Agent will monitor for new subscriptions by continuously monitoring new blockchain event log *LogChannelCreated*.

Offering Messaging Channel usage

When Agent get new event *LogChannelCreated*, he will get authentication message as one of event parameters. Agent will retrieve authentication message from offering message channel by hash of authentication message.

Account setup

Before Agent will setup Clients` account in DB, he will:

- verify signature of authentication message
- verify that signature corresponds to Clients` public key
- verify that Clients` Ethereum address (part of state channel) corresponds to Clients` public key
- decrypt password field from authentication message, using Agents` private key

On successful verification Agent setups account in DB, where

- username = state channel key

password = decrypted Client's password

Secure password storage using encryption at rest is out of scope of this document

Service Endpoint discovery

Client needs to know Agents' endpoint address to connect and start using service. To prevent third party to get all endpoints addresses easily, Agent will encrypt endpoint data with Clients' public key. It will require from Client to create state channel first and publish authentication message, which contains Client's public key. Agent will form specific message according to

Endpoint message template

Filed name	Field type	Field length	Description	Allow null	Example
template_version			Version of template		2
dns			Endpoint DNS address	Yes	subdomain.domain.com
ipv4					195.49.100.100
ipv6				Yes	2001:0db8:85a3:0000:0000:8a2e:0370:7334
uuid			Random number to allow generation of identical authentication with different hash. Possibly UUID4 generated according to RFC4122.		ea864be6-db42-43e2-bffa-aa44ace573f0
signature			Cryptographic signature of authentication message generated using Client's private key.		1HZwkjkeaoZfTSaJxDw6aKkxp45agDiEzN GyjfdCnYYNVCE0plqKKrnNXkaQrbbPnD e2r59jZJSWlicL6YMi/zaH6VhykqBpQWAK pHA+4fxyuiAcSzZAUK9A=

DNS is preferred type of endpoint address, as there is currently no method to rediscover endpoint in case IP address of Agent changes.

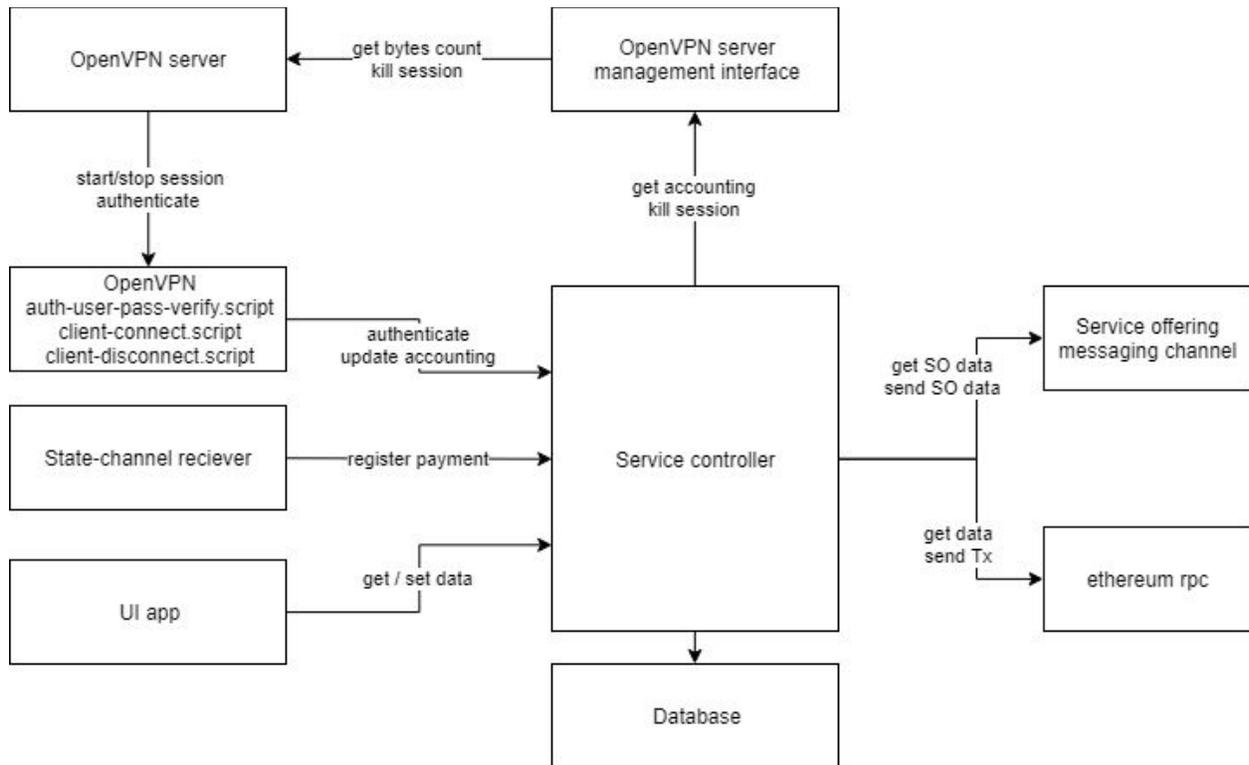

Blockchain usage

Agent will publish endpoint message using smart contract function *PSC.publishServiceOfferingEndpoint()*. This function will emit event *LogServiceOfferingEndpoint*. Client will listen to this event and will get endpoint hash as parameter of event.

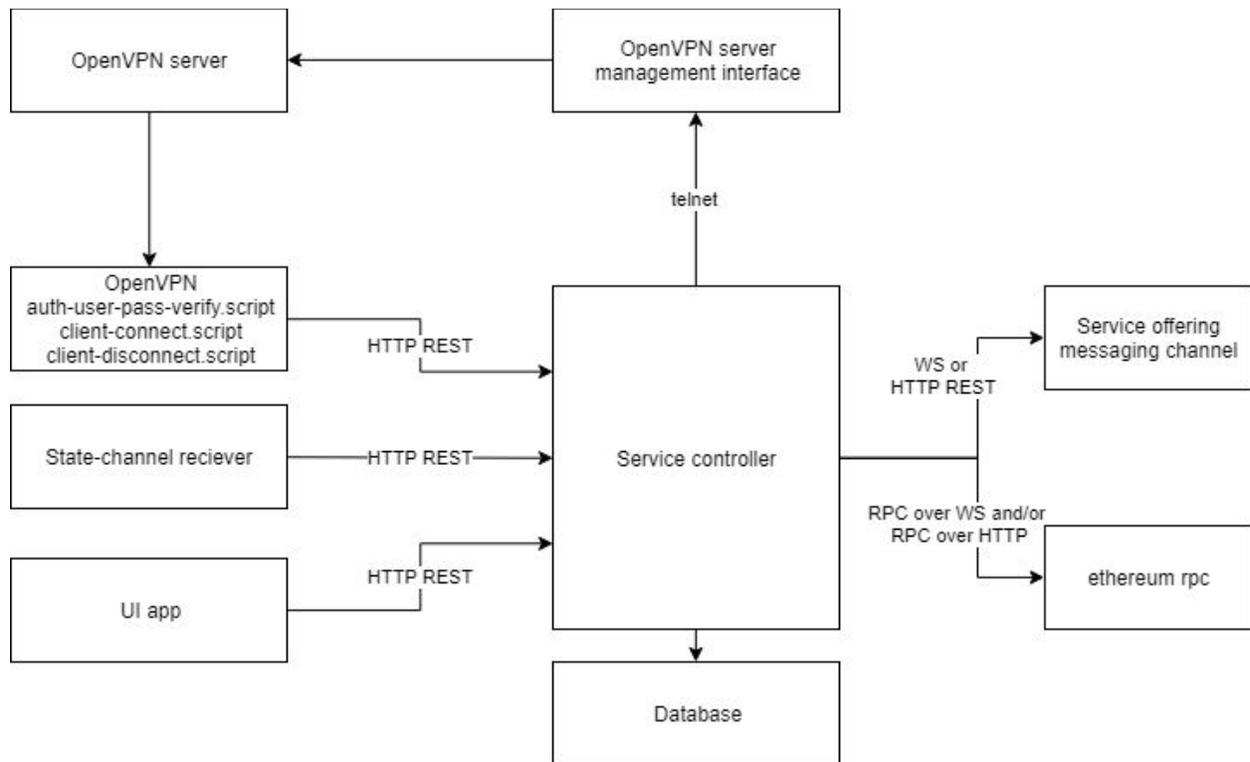

Offering Messaging Channel usage

Client will retrieve endpoint message from offering messaging channel using its' hash. He will check that endpoint message conforms to known scheme and store in DB, if verification is passed. Client is ready to start using service.

5.6 Service controller functional scheme

5.7 Service controller protocol scheme

5.8 Glossary

General

Privatix Company	Privatix (Privatix.io) company develop software and process, which will allow Privatix network users to provide and consume services.
Privatix Network	Network that consists of nodes (users) on this network, which can sell and buy Privatix Services using PRIX tokens
PRIX Token	Token on ethereum blockchain that was created during Privatix.io Token Sale
Privatix Service (service)	Digital good that is offered by Agent and can be consumed by Client on Privatix network
Marketplace	Website maintained by Privatix Company that will simplify usage of Privatix Network as well as perform some messaging function on early stages of development process. All messaging functionality is expected to be moved on decentralized channel on latter stage of development.

Technical

Agent	Participant of Privatix network that wants to sell services.
Client	Participant of Privatix network that wants to buy services.
Service offering (SO) (aka Offering)	Properly filled and signed Service Offering Template. Service offering purpose is Agent's proposal of Privatix Service, which describes its parameters and conditions of sales for specific service. Service offering format is published by Privatix company in form of Service Offering Template

Service Offering Template (SOT)	Documented format, that Agents uses to publish their Service Offering. Format MUST be known by both Client and Agent to successfully agree on Service Offering
Service Authentication Template (SAT)	Documented format, that Client uses to pass authentication data to Agent. Agent will authenticate Client, when Client start using service according to data specified in this template. Format MUST be known by both Client and Agent to successfully perform authentication.
Service Endpoint Template (SAT)	Documented format, that Agent uses to pass Service Endpoint Address to Client. Client will connect to Service Endpoint using data in this template. Format MUST be known by both Client and Agent to successfully connect to service.
Agent Key	Cryptographic key pair generated according to appendix F. of Ethereum Yellow paper , which is used by Agent to encrypt/decrypt and sign messages.
Client Key	Cryptographic key pair generated according to appendix F. of Ethereum Yellow paper , which is used by Client to encrypt/decrypt and sign messages.
Agent Ethereum Address	Ethereum address of corresponding Agent's Public Key.
Client Ethereum Address	Ethereum address of corresponding Client's Public Key
Service Offering message (aka offering message)	Filled Service Offering Template.
Service Authentication message (aka authentication message)	Filled Service Authentication Template.
Service Endpoint message (aka endpoint message)	Filled Service Endpoint Template.
Offering message hash	Hash of filled Service Offering Template using SHA3 (according to Ethereum Yellow paper).
Authentication message hash	Hash of filled Service Authentication Template using SHA3 (according to Ethereum Yellow paper).

Endpoint message hash	Hash of filled Service Endpoint Template using SHA3 (according to Ethereum Yellow paper).
Privatix Token Contract (PTC)	Ethereum contract that holds PRIX token that were minted during Privatix.io Token Sale.
Privatix Service Contract (PSC)	Ethereum contract that controls service usage logic and payment processing by Agents and Clients.
Service Deposit	Deposit that is placed to Privatix Service Contract by Client to prevent double spending and guarantee payment to Agent for Privatix Service.
Service Offering Messaging Channel	Channel that used to publish full Service Offering message, Authentication message and Service Endpoint message. Used by Agent and Client to exchange necessary information that allow Client to start using Privatix Service proposed by Agent.
Service Endpoint	Node that provide Privatix Service and operated by Agent.
Service Endpoint Address	DNS or IP address of Agent service node, that Client will use to receive service.
Marketplace	Web site maintained by Privatix Company that will simplify usage of Privatix Network as well as perform some messaging function on early stages of development process. All messaging functionality is expected to be moved on decentralized channel on latter stage of development.

Products names

VPN	Centralized VPN service , like Privatix.com
dVPN	Decentralized VPN service based on Privatix Network (As described in privatix whitepaper , section 7)
dCDN	Decentralized CDN based on Privatix Network (As described in privatix whitepaper , section 7)

dProxyMarket	Decentralized Proxy Market based on Privatix Network (As described in privatix whitepaper , section 7)
Privatix.BOX	Hardware device, portable VPN router based on Privatix Network (As described in privatix whitepaper , section 7)
Privatix.FAAS	Anti-censorship solution for developers (SDK) based on Privatix Network (As described in privatix whitepaper , section 7)

6. Markets overview

Below is a brief overview of the target markets for the Privatix Network and possible products that can be made by using the network capabilities of buying / selling internet bandwidth.

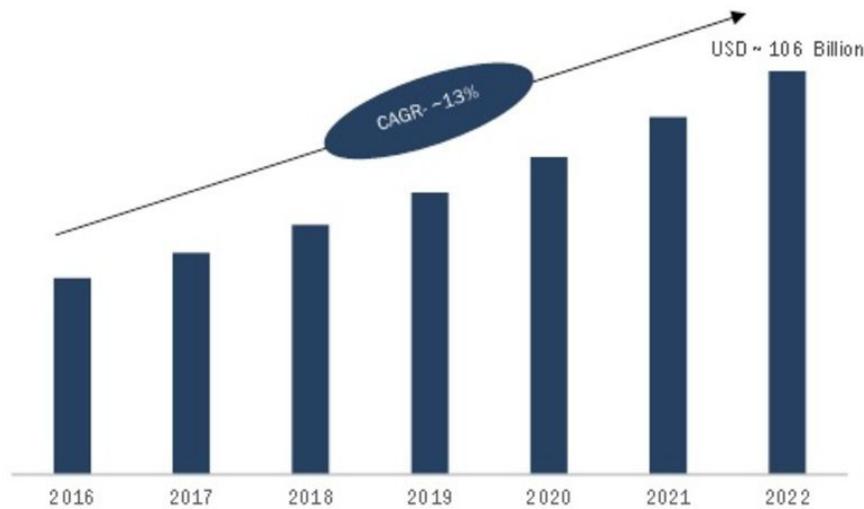

6.1 Global VPN market

There was an estimate of 3.5 billion internet users worldwide in 2016. This means that about 45 percent of the global population accessed the internet that year. The majority of global internet users are located in East and South Asia, while China is the largest online market in the world.

In 2016, China had over 721 million internet users, more than double the amount of third-ranked U.S., with nearly 290 million internet users. The global average internet speed stood at 6.1Mbps that year.

With the proliferation of inexpensive smart phones, many of today's 5 billion feature phone users will convert to internet users in the next 5 years. New users will mainly reside in countries with strict or strengthening internet censorship.

According to latest reports, the Virtual Private Network (VPN) market is expected to reach USD 106 billion by 2022 at a CAGR (compound annual growth rate) of 13%.

The major driving factors of this market are increasing internet censorship, an increase in the number of loud security incidents, growing industries, and the increasing number of connected devices mostly in countries with strict internet censorship; countries like China, countries in Asia and Africa, and now Russia as well.

There is no leader who controls more than 10% of the VPN market. Most of the 400 primary VPN providers compete for a small fraction of market share.

The most well-known players are: Hotspot Shield (Anchorfree¹) backed with more than \$62 million invested by VC's, Zenmate² with more than \$3 million in investments, and Hidemyass (Privax) that was acquired by AVG in 2015 for \$40 million³.

¹<https://www.crunchbase.com/organization/anchorfree>

²<https://www.crunchbase.com/organization/zenguard>

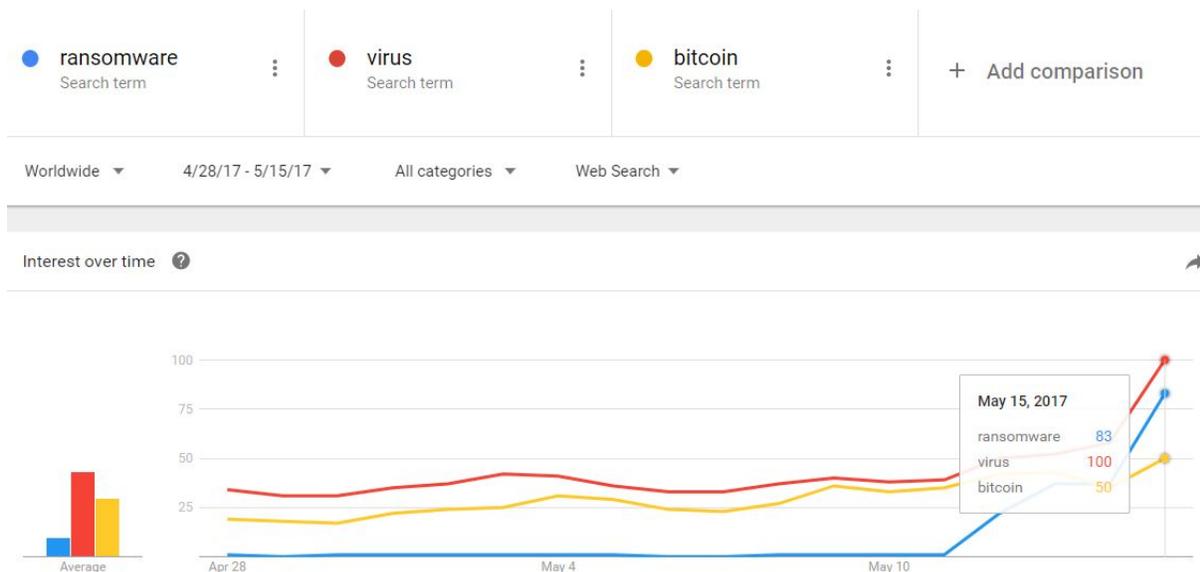

³<https://now.avg.com/avg-acquires-privax/>

6.2 Cyber security and privacy protection

According to Zion Market Research⁴, the global cyber security market was valued at USD 105.45 billion in 2015; is expected to reach USD 181.77 billion in 2021 and is anticipated to grow at a CAGR (compound annual growth rate) of 9.5% between 2016 and 2021.

Cyber security is associated with information technology security, which focuses on protecting computers and confidential data stored in it from cyber criminals. The cyber security market provides several benefits, including enhanced security of cyberspaces, expanded digital safeguards, and quicker reaction time to national crises. These benefits automatically enhance the value of services to market end-users.

An example of a major cyber security issue is linked ransomware attacks when people's computers are locked and bitcoin payment demanded by cyber criminals to unlock. These events have increased awareness of encryption and protection issues.

Google Trends show spike of interest to ransomware, viruses, and bitcoins after attacks

⁴<https://www.zionmarketresearch.com/sample/cyber-security-market>

The cyber security market is segmented based on security types, solution and vertical, and by regions. On the basis of security types, the market is divided into network security, cloud security, wireless security, and others. The cyber solution segment includes identity and access management (IAM), encryption, risk and compliance management, data loss prevention, antivirus and anti-malware, firewall, and others. By vertical, the market is segmented into aerospace, government, financial services, telecommunication, healthcare, and others.

6.3 CDN

Companies leverage Content Delivery Networks (CDN) to increase their online presence in the global market and deliver a high-quality user experience worldwide. CDNs improve site speed, page load times, availability, and performance dramatically. This not only results in higher end-user satisfaction but also increases customer adoption and conversion rates⁵.

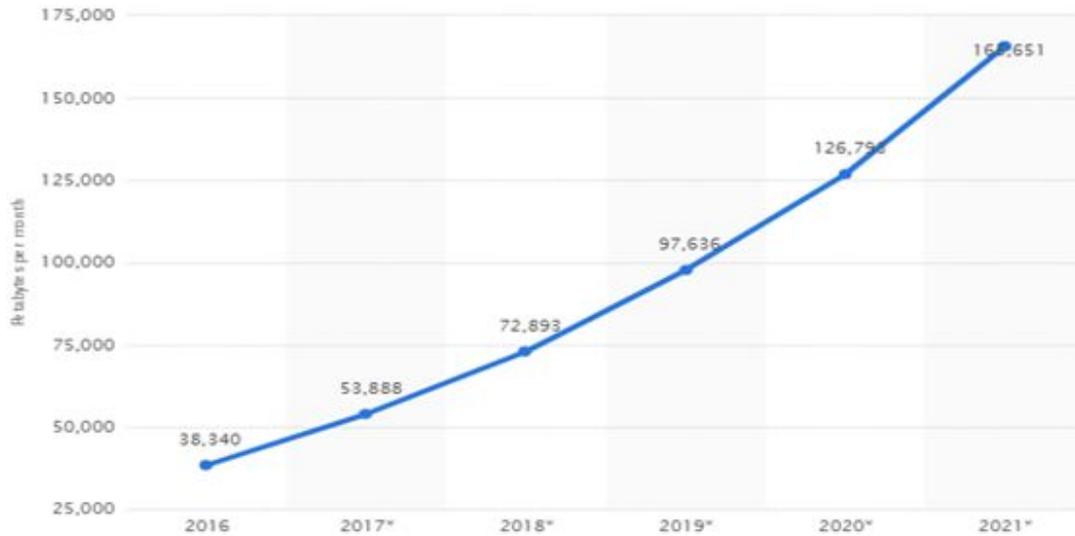

Market size and growth trends

- The market size of CDN is expected to grow from \$4.95 billion in 2015 to \$15.73 billion in 2020, and to \$70.3 billion by 2025.
- The mobile CDN market is estimated to grow from USD 2.11 billion in 2015 to USD 13.40 billion in 2020, at a compound annual growth rate CAGR (compound annual growth rate) of 44.7% from 2015 to 2020. In regional segmentation, North America is expected to be the largest market in terms of market size, while APAC, Latin America, and MEA are expected to emerge rapidly in this market at high CAGRs.
- The North American region dominated the CDN market in 2015 and is expected to reach \$4.6 billion by 2017.
- There are approximately 8.8 million websites using CDNs worldwide.
- Out of the top 10,000 websites, 48.3% are currently using a CDN.
- CDNs, globally, currently serve 50% of content consumed over the internet⁶.

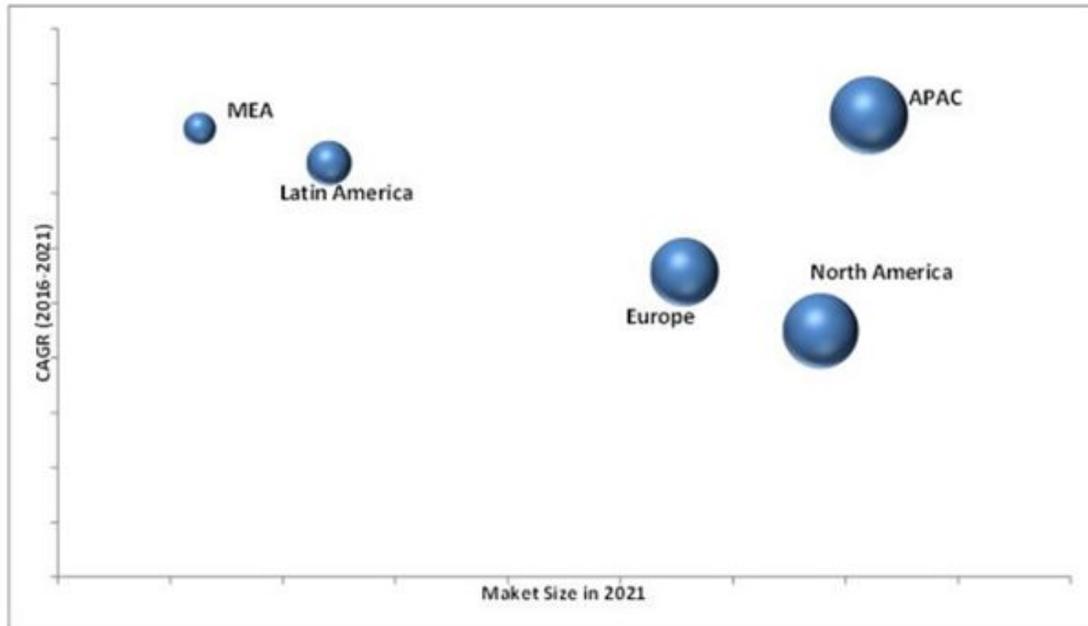

⁵<https://www.cdnetworks.com/en/news/content-delivery-network-and-website-performance-stats-2016/513>

⁶<https://www.cdnetworks.com/en/news/content-delivery-network-and-website-performance-stats-2016/513>

- In 2018, worldwide online CDN traffic is expected to reach 72,893 petabytes per month. The data volume of global CDN internet traffic from 2016 to 2021 (in petabytes per month)⁷ is illustrated in the graph below.

Content Delivery Network Market, by Region, 2021(USD Billion)

⁷<https://www.statista.com/statistics/267184/content-delivery-network-internet-traffic-worldwide/>

Growth drivers

- Proliferation of rich media and video content - expected to grow at 4G speed
- Increasing use of connected and smart devices
- Optimized network solutions
- Digitization among organizations
- Highest growth in the online gaming industry

Competitive landscape

The top 10000 websites in the world use the following platforms⁸:

⁸<https://www.similartech.com/categories/content-delivery-network>

6.4 Business intelligence and data collecting (Proxy / Socks gateways)

The global business intelligence (BI) market was worth \$14.15 billion in 2015 and projected to reach \$26.89 billion by 2020. BI technologies have slowly but steadily revolutionized the field of business strategy and management and penetrated all over the world⁹.

Market size and growth trends

- The global BI market is estimated to grow at a compound annual growth rate (CAGR) of 9.5% between 2016 and 2021¹⁰.
- Global revenue in the BI and analytics software market is forecast to reach \$18.3 billion in 2017, an increase of 7.3% from 2016, according to Gartner, Inc¹¹.
- Data discovery / visualization, self-service BI, and data quality / master data management are the three most important trends¹².
- While the use of traditional dashboard BI is receding into the background, self-service machine data analytics, self-service data discovery and explorations, and BI and analytics in the Cloud are rapidly gaining momentum across the global spectrum¹³.
- There is increasing investment in robust BI platforms that can handle multiple data management capabilities such as integration, storage, visualization, statistical and quantitative analysis, instead of multiple specialty tools.

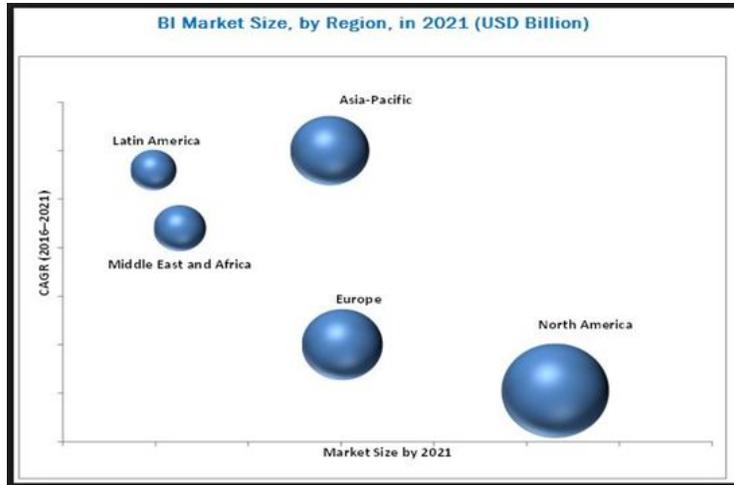

⁹<https://www.mordorintelligence.com/industry-reports/global-business-intelligence-bi-vendors-market-industry>

¹⁰<https://bi-survey.com/top-business-intelligence-trends-2017>

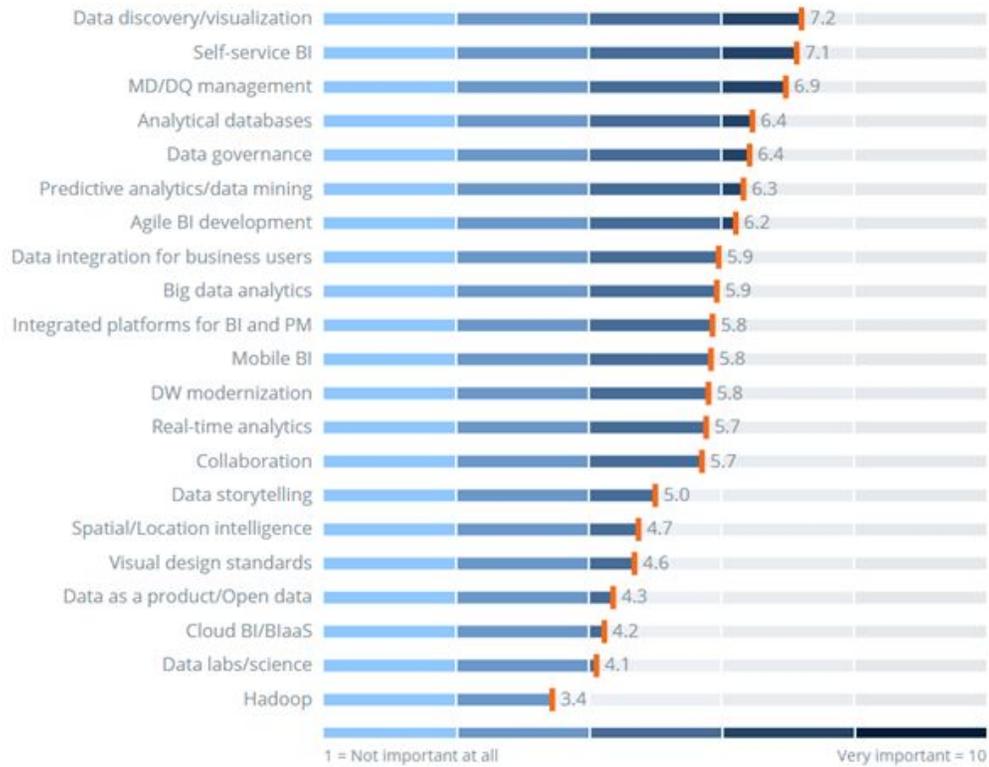

¹¹<http://www.gartner.com/newsroom/id/3612617>

¹²<https://bi-survey.com/top-business-intelligence-trends-2017>

¹³<http://www.dataversity.net/comparative-study-business-intelligence-analytics-market-trends/>

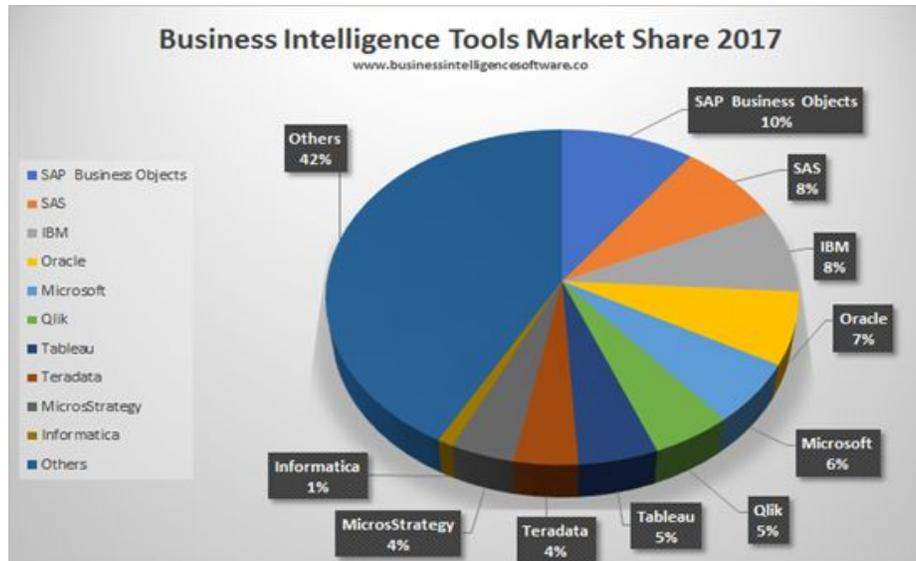

Importance of Business Intelligence Trends in 2017 (n=2,772)

Growth drivers

- Increasing usage of data analytics
- Rising penetration of cloud technologies
- Need for complex datasets drives investments in data preparation

- Increasing adoption of BI in small- and medium-sized enterprises
- Support for real-time events and streaming data

Competitive landscape (including list of most prominent players)

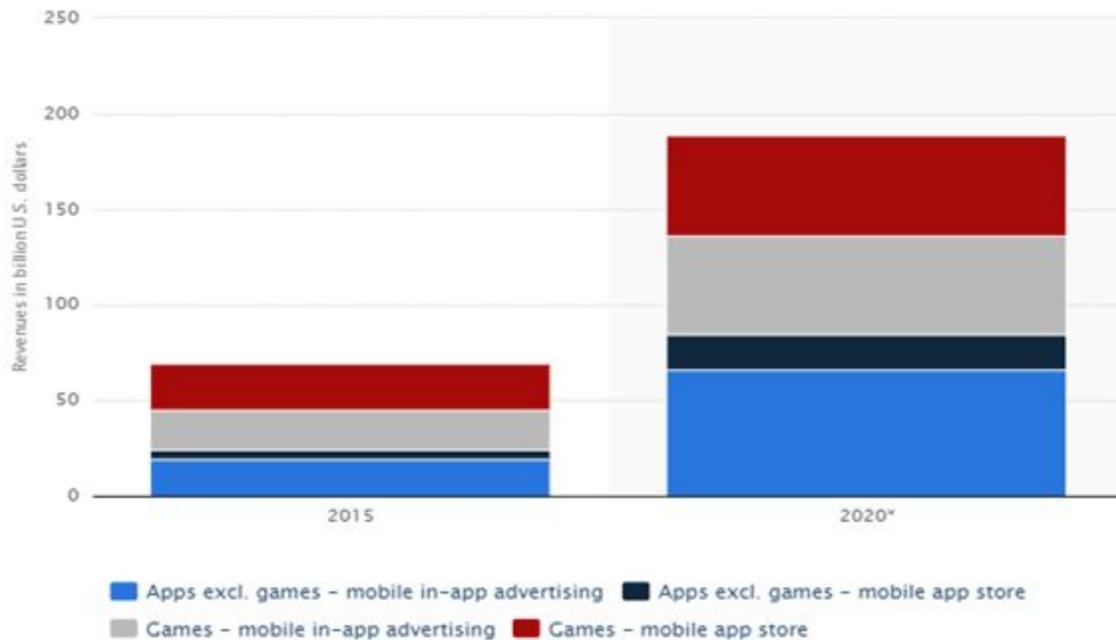

- Some of the key players in the global BI market include Information Builders, International Business Machines Corporation, Datawatch, Microsoft Corporation, Microstrategy, Inc., Oracle Corporation, Panorama, Pentaho (a Hitachi Company), Qlik Technologies, SAP SE, SAS Institute, Sisense Inc., Tableau Software, Tibco Software, and Yellowfin International Pty Ltd.
- Gartner's Magic Quadrant for Business Intelligence and Analytics Platforms.

6.5 Mobile apps and software monetization

Trends point to hybrid monetization models, such as in-app ads and in-app purchases. In-app advertising is set to be a key driver of mobile growth over the coming years.

Market size and growth trends

- In 2015, the mobile app industry generated \$69.7 billion in gross annual revenue; it is projected to exceed \$189 billion by 2020¹⁴.

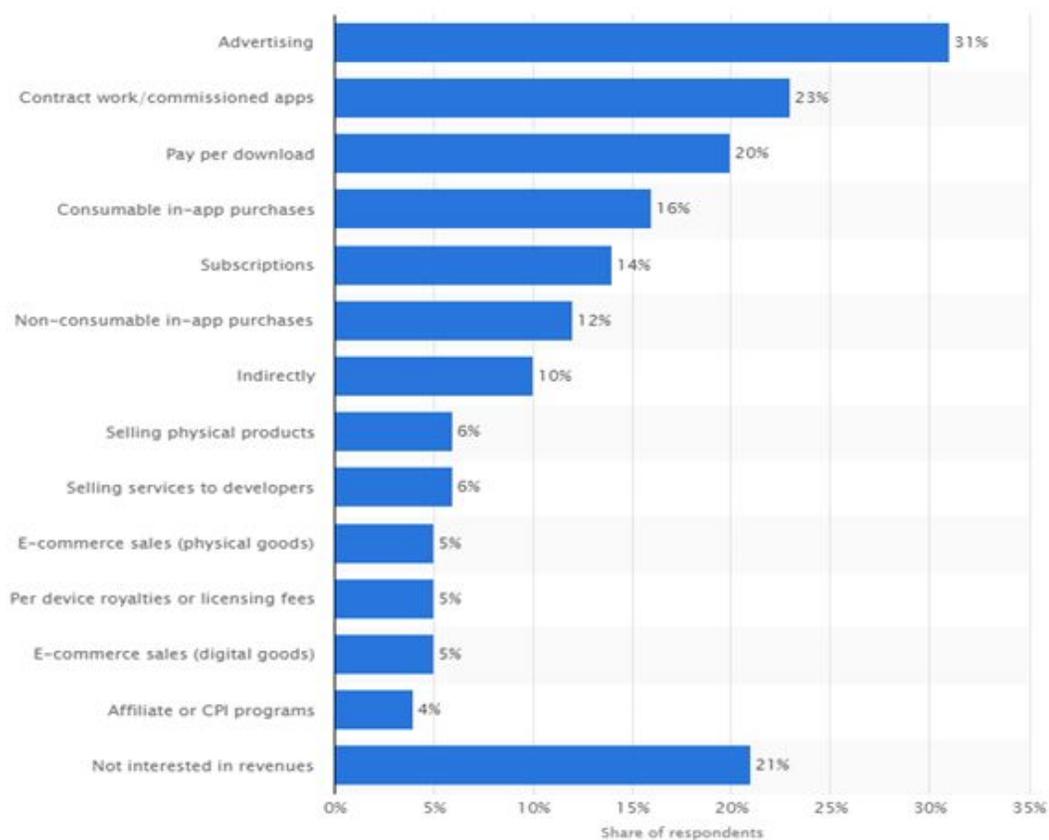

© Statista 2017

- The worldwide in-app advertising and app store revenues of mobile apps and games in 2015 and predicted in 2020 is illustrated below (in billion US\$):

¹⁴<https://www.statista.com/statistics/293636/app-store-composition-business-models/>

2015		2020*	
• Apps excl. games – mobile in-app advertising	19.3	• Apps excl. games – mobile in-app advertising	65.8
• Apps excl. games – mobile app store	4.5	• Apps excl. games – mobile app store	18.8
• Games – mobile in-app advertising	21.1	• Games – mobile in-app advertising	51.4
• Games – mobile app store	24.8	• Games – mobile app store	53

- May 2016 - Android device owners spent an average of \$15.53 making in-app gaming purchases; in contrast, iOS device owners spent \$10.96.¹⁵
- December 2016: 92% of games on Google Play were free to download, and 23% of those used in-app purchases as a monetization model¹⁶.
- Top app monetization models according to mobile developers worldwide (June 2015):

¹⁵<https://www.statista.com/statistics/673479/mobile-games-Android-share-monetization-model/>

¹⁶<https://www.statista.com/statistics/673479/mobile-games-Android-share-monetization-model/>

- North America is the leading region in third party in-app advertising both in absolute and relative terms; Asia Pacific will record the largest increase in the next five years at a 177% compound annual growth rate between 2015 and 2020.

Growth drivers

- Customization apps
- Aggregator apps
- Enterprise apps – micro and hybrid
- Software subscription model
- Messaging apps
- Internet of Things¹⁷
- Android First¹⁸
- UX, accessibility, and security are more important than ever

Competitive landscape

- 9 million mobile app developers in the world; 60% make \$500 or less profit per month
- Less than 0.1% of all apps are commercially successful
- Companies that focus on mobile in-app advertising command the majority of the mobile advertising market and companies that focus on native advertising as a primary revenue stream are the most successful at monetizing through mobile¹⁹.
- Top app monetization solution providers include:²⁰
 - Google AdMob
 - Facebook Audience Network
 - Inneractive
 - OpenX Mobile
 - Unity Ads

¹⁷<https://www.cnbc.com/2015/11/09/forrester-mobile-predictions-for-2016.html>

7. Products and services – Proof of Concept

This section will describe Proof of Concept (PoC) products based on the Privatix Network, as well as the concept of the exit nodes software for Agents (owners of exit nodes).

7.1 Privatix.Agent - cross-platform software for exit nodes owners

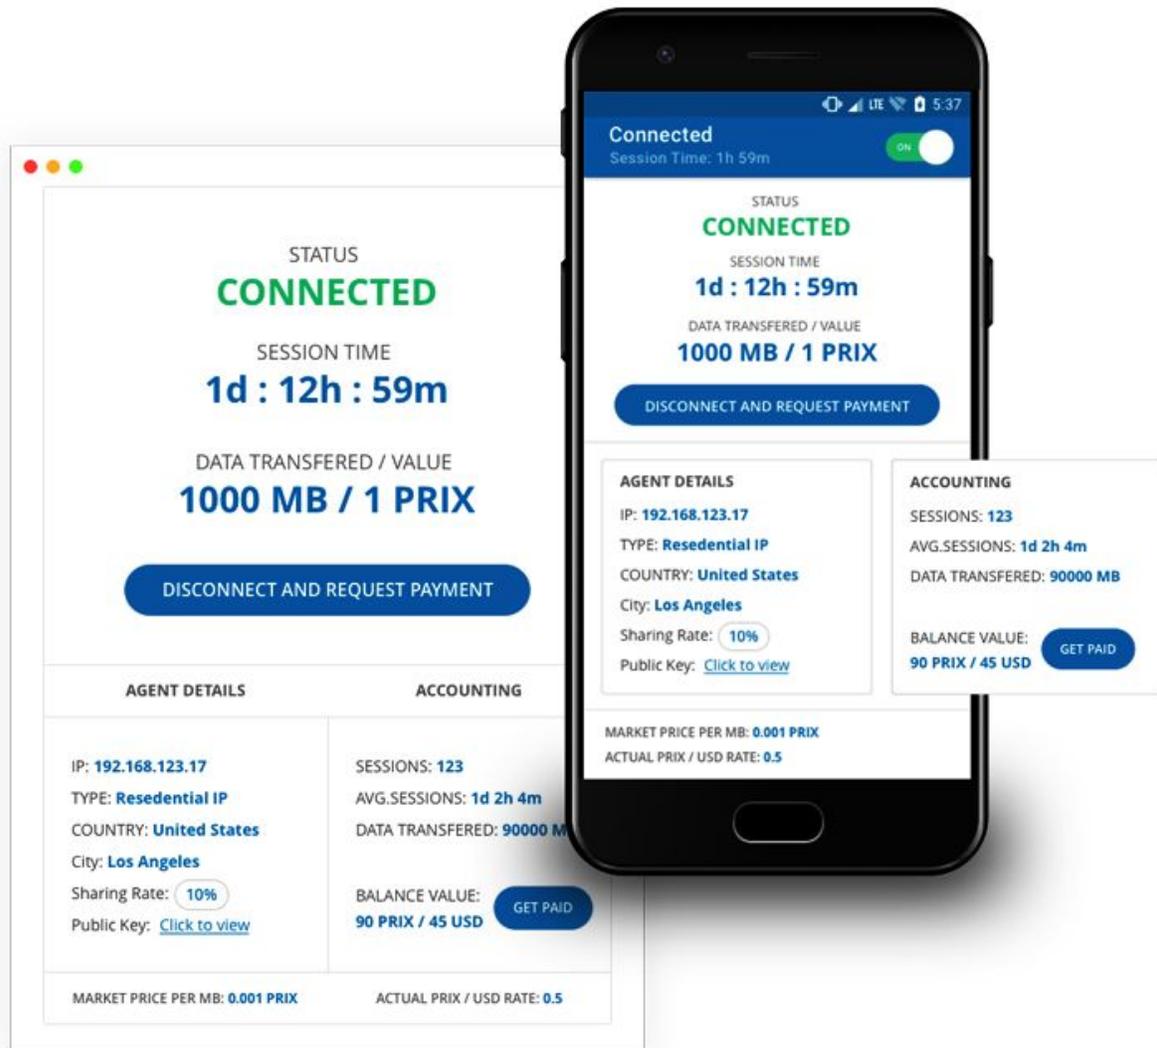

This software is the primary component of the Privatix Network as it is the one that technically and practically allows the Agents to join the network and start selling their internet bandwidth.

USE CASE

- The user learns about the opportunity to earn by selling his unused broadband
- The user downloads software for his operating system and launches it
- The user sets the percentage of the traffic that he wishes to share and registers on the network
- After connecting to the network, the user turns into an Agent, his IP is recorded on the network, and Clients can now connect to him
- The user can see all accounting and stats in real time
- After accumulating a balance in PRIX tokens, the user can sell them on the exchange straight way or order withdrawal in a fiat currency. After that, we will sell their token at the exchange and send the payment to the user in a fiat currency.

Alternative solution on the market: <https://mysterium.network> (concept only)

USER INTERFACE PROTOTYPE

Privatix.Agent will be developed on major platforms in order to create total operational system coverage.

The user will also be able to choose if he wants to share his connection for torrenting or not; there are many countries where torrenting is forbidden and fines may be imposed. We will pre-set by default countries where this policy is applied, and disable the torrenting option in advance.

7.2 Consumer VPN based on DPI-free VPN protocol

VPN means Virtual Private Network, a secure tunnel between two or more devices. VPN creates a secure tunnel between your computer and the internet, allowing you to surf the web anonymously from wherever you want. VPN also hide your IP address and changes it to another one.

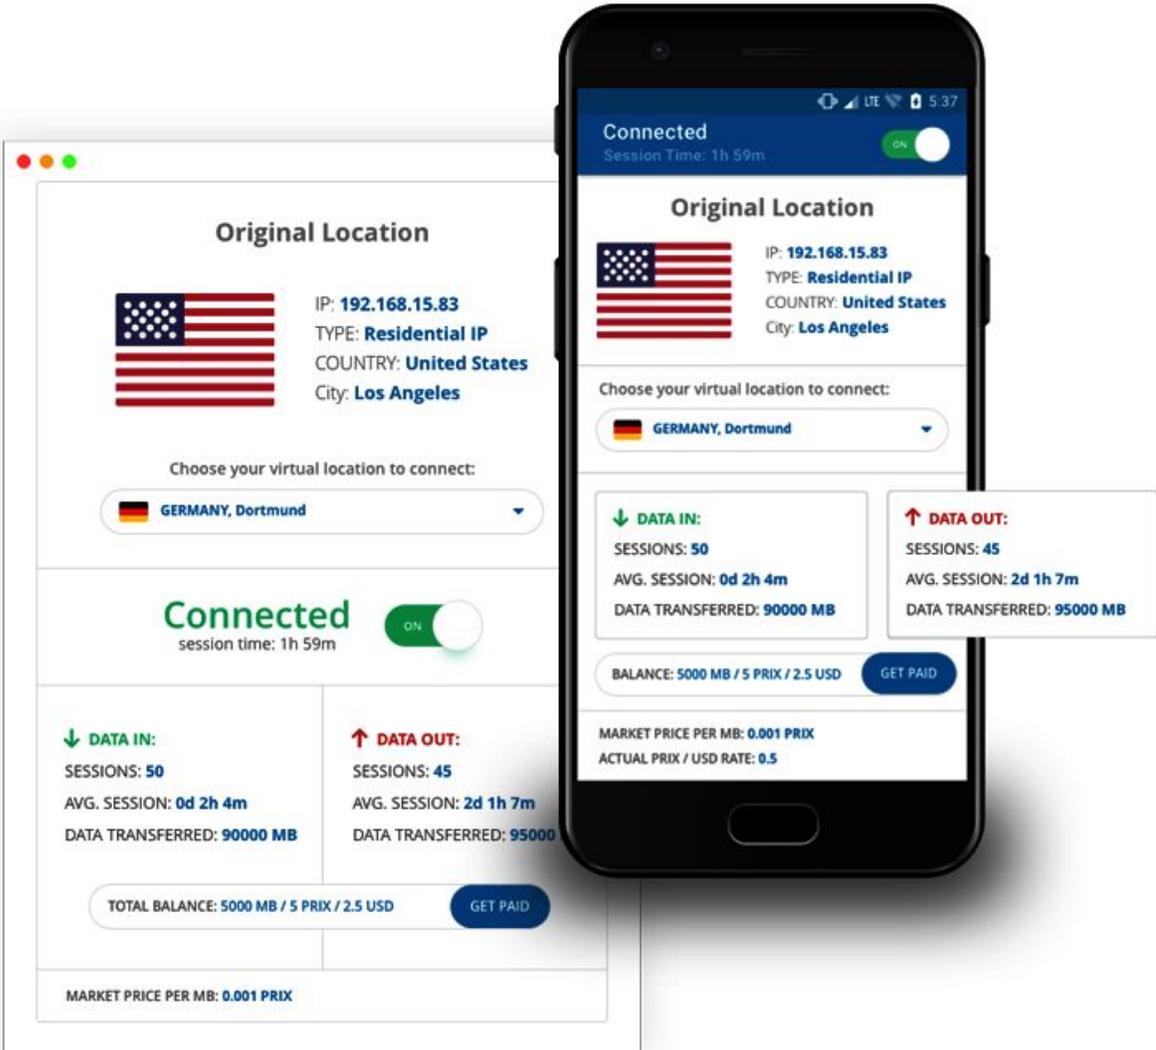

Classic VPN providers use dedicated servers around the world and standard VPN protocols like Openvpn, pptp,l2tp,sstp, etc.

VPN shields your privacy, helps to avoid internet censorship and encrypts your transferred data. The problem of centralized VPN is DPI-based blockers (utilized in China) and data server's IP's that detect when you use a VPN.

VPNs based on the Privatix Network will allow you to surf between millions of exit nodes at the best available speed and use advanced modified VPN connections that are undetectable by DPIs. If you choose to be a peer in the network, you will be able to pay for it by sharing your traffic with other users. If you get more traffic than you give you will have to pay the difference. Vice versa the difference will be paid to you.

Classic VPN service	Decentralized VPN on blockchain
<ul style="list-style-type: none">● Focused on owner's profit ONLY● High profit margins● Huge marketing and data costs● No complete anonymity● Risk of data access by a third-party Can be blocked by sophisticated DPI● The fact of using VPN is visible● Slow speed and unstable connection	<ul style="list-style-type: none">● Focus on network participants' benefits● Fair prices without middleman margins● Low traffic expenses● Full anonymity● No private data and logging, no access for a third-party● Can't be blocked● The fact of using VPN is invisible● High speed and stable connection

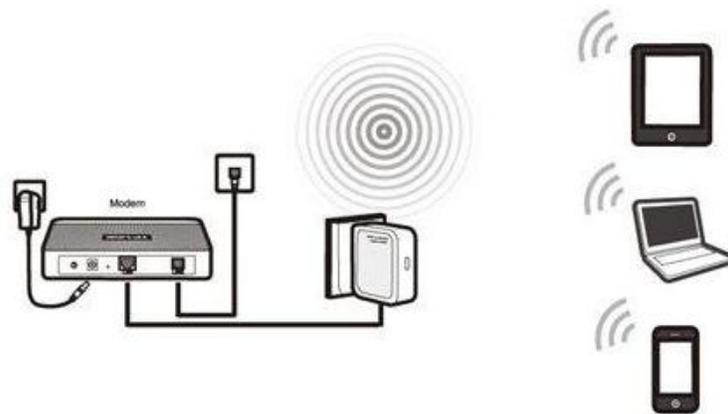

Prototype of VPN client based on Privatix Network

7.3 Privatix.BOX - portable VPN router

A hardware device (basically an advanced DD-WRT router with pre-set configuration) which allows:

- Connection to the Privatix Network as an Agent without the need to install special software
- Shared VPN-protected connection via Wi-Fi

Members of the Privatix team have been using our prototypes of these devices, which we created on the basis of popular DD-WRT routers, for a long time. This device is particularly useful for travelers and acts as Agent and Client in the Privatix Network without the need to install any software. We also plan to produce these devices in partnership with a suitable manufacturer.

USE CASE

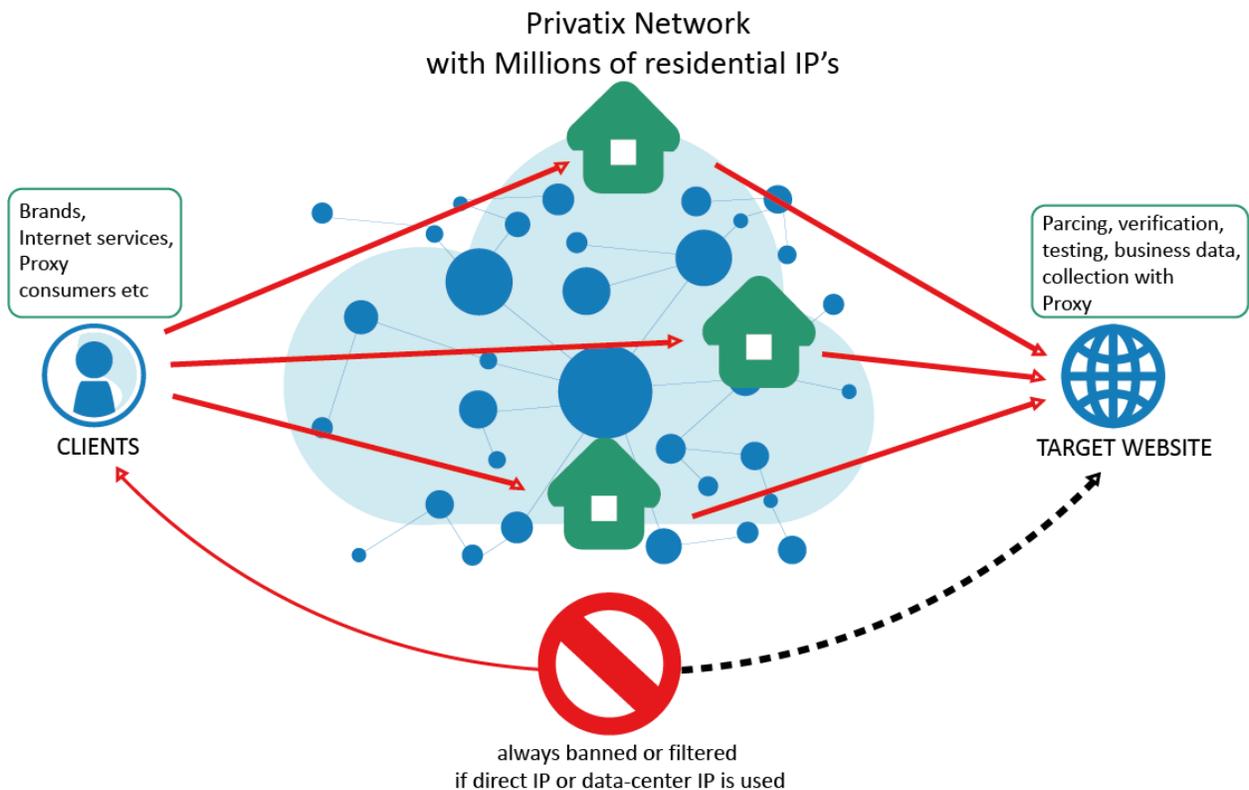

- A user goes on vacation with his family and stays in a hotel
- The user connects Privatix.BOX to an unprotected Wi-Fi hotspot in the hotel
- The user encrypts his connection and shares this safe connection with other family members via Wi-Fi

- If the user opted to be an Agent (share broadband), then most likely the user will get an excellent and fast VPN at no cost at all.

Alternative centralized solution / product on the market: <https://keezel.co>, <https://betterspot.com>

7.4 Advanced Proxy / Socks selling API platform

When the Privatix Network is established, it will contain hundreds of thousands, even millions, of connected devices (Agents) and most of them will have residential IP-addresses.

For thousands of companies and businesses, residential proxies are a vital and also scarce resource. Online retailers collecting comparative pricing information, developers testing their web sites from any city in the world, large ad networks using proxies for ensuring the ads they

deliver are safe and compliant, cybersecurity firms checking sites are not malicious, and business intelligence tools use thousands of proxies every day to parse search engines or competitors' websites.

Our product will include an advanced API through which anyone will be able to buy the use of proxies (traffic) from Privatix Network Agents in a convenient and easy way.

USE CASE

- A large online retailer deals with the daily challenge of collecting data on positions and prices on their competitors' websites
- Data parsing directly from their servers using datacenter IP addresses even in the rotation does not work. The IPs are quickly detected by the competitor and blocked.
- By connecting their software to the platform API, the retailer's developers can buy an unlimited number of proxies with residential IP addresses and completely mask their activity
- Rotating them and paying only for traffic means the retailer can solve their business objectives in very simple and convenient way

7.5 Infrastructure for VPN providers

All classic VPN providers on the market today use the infrastructure of dedicated servers in different data centers and purchase IPV4 IP address pools. This has a number of serious shortcomings:

- Limited ability to buy new IPV4 IP addresses
- Expensive maintenance of server infrastructure, balancing, etc.
- High broadband costs

- Most IP addresses from the data center are easily detected and blocked, unlike the IP addresses of home or small offices computers (residential IPs)

Replacing the infrastructure of dedicated servers with a convenient and affordable platform that can be implemented in the product will transform this market, dramatically reduce the cost of broadband for VPN providers, and improve their ability to stay unblockable with residential IP addresses.

7.6 Decentralized CDN on blockchain

At Privatix Network, we do not want “merely” to develop awesome products, eliminate the middleman and reduce prices, but to speed up the entire internet as well.

Classic CDN today is a very profitable business. However, content is becoming heavier, and more expensive, because of the increasing use of HD videos, games and streaming content.

The average price for content delivery today is \$0.05 - \$0.30 per GB. We believe that by using Agents’ broadband from Privatix Network will allow slashing prices 5 or even 10 fold The main condition for this is a large number of Agents in the network.

This proposal is concept-based and can only be developed if the network grows big enough and we have funds to invest in R&D.

7.7 Privatix.FAAS - anti-censorship solution for developers

Freedom as a Service (FaaS) - this is the driving force behind Privatix.FAAS. Our goal is to create powerful SDKs that will eliminate the need for developers to worry whether their app will be blocked in some country or not.

Privatix will provide a mobile SDK that will be easy to integrate into any mobile application or software and give developers the ability to send all traffic via the Privatix Network's secure Agents' proxies, ensuring users always have secure and private access to their applications and are never blocked.

Alternative centralized solution / product on the market: <https://www.anchorfree.com/sdk/>

7.8 Privatix.Monetize - mobile apps and software monetization platform

Developers build applications used by millions of people and, in many cases they can't monetize it as they would like to do.

The most popular monetization methods are paid subscription and ad injection. Both methods always lead to a huge outflow of users, and a decrease in virality as users do not like to pay to watch ads.

Privatix.Monetize will offer developers an SDK that will help to monetize their apps without ads or paid content using the following scheme. Users install the app, which registers in the Privatix Network as an Agent and starts selling the users' idle bandwidth while the developer gets the payment for the traffic.

8. The Privatix team

Our team has an established record of creating world-class internet services in the VPN and cyber security arena for more than 10 years. We have the proven ability to develop amazing products and run successful internet businesses. Check out our products and maybe you discover that you are already our customer.

8.1 Our last projects track record

The Privatix team currently serves more than 50,000 active users per day and transfers over 10 Petabyte traffic per month through more than 150 of its servers. The customers of our internet services and projects are, literally, millions of users. We know exactly how to build, manage and develop products in the areas of privacy and internet security. You can read below about some of our current projects.

Name	Privatix VPN
URL	https://privatix.com
Exists since	2015
Market	VPN service and privacy protection
Business model	Freemium + ad-based
Platforms	Native mobile apps on iOS and Android; browser extensions for Chrome, Opera, and Firefox; and desktop software on Windows
Total users	More than 1,250,000
Daily active users (DAU)	~50,000 - 70,000
Average growth rate (monthly)	9-10% per month in last 2 years

Name	Temp-mail - temporary email service
URL	https://temp-mail.org
Android app link	Google Play
Ios app link	App Store
Exists since	2012
Market	Internet services - email
Business model	Advertising
Audience	More than 200,000 daily and ~5 billion per month
Mobile apps installs	More than 500,000 in last 6 months (organic)
Average growth rate (monthly)	5-10% per month in last two years

8.3 Our “Unfair Advantage”

Almost always, behind great ideas stand dreamers, advocates of the “idea first” paradigm. Ideas are important but without resources, knowledge, skills, and experience they remain elusive.

At Privatix there are all the necessary components of a successful team that has proved itself in various projects over the past years, and our record is demonstrable. This team will become the backbone of the future Privatix Network company which will attract even more talented employees with vision and entrepreneurial spirit, and the hi-tech skills needed in this demanding industry.

This is the first time we have tried to attract investments. But now it has become clear to us that it is simply impossible to implement such a large-scale project as Privatix Network without significant funding. Our goals and intentions are clear, and we know how to achieve them. Believe in us now and you will participate in the birth of a new global company that will change the world for a better one.

9. Roadmap

This roadmap is representing projected intentions and may be a subject to changes according to the technical development and testing progress.

9.1 First steps

We will have several months until the end of the year in which we want to prepare the company for the next steps as quickly and efficiently as possible.

9.1.1 First month priorities

We have some top priority tasks that must be finalized in the first month after Token Sale. We will report on these steps and our progress to the community:

- Distributing all bounty tokens to participants and suppliers
- New office spaces renting or expanding current ones in Ukraine, Israel, and Russia
- Transferring to third-party management, “canning / preserve”, or sale of existing projects of the company
- Hiring administrative personnel

9.1.2 Legal, HR and administrative issues

Some legal formalities, as well as financial business processes, will need to be adjusted and facilitated during this period.

Also, the procedure for selecting and hiring new team members will be started. The procedure for hiring talented people is not always easy and it can be time-consuming to source the best, but with our experience and funding, we will be able to afford to hire the most skilled and motivated people. We know exactly who we are looking for.

9.2 Q4 / 2017 - Q2 / 2018 : Privatix Network Core Development

The final quarter of 2017 and the first two quarters of 2018 will be used to develop a prototype and Alpha version of the Privatix Network, as well as cross-platform software for Agents.

Deadline: The end of the second quarter of 2018

9.2.1 Privatix Network - Alpha

The first release of the Privatix Network will include centralized elements and will be available in open source to receive feedback from the community by the end of the second quarter of 2018.

9.2.2 Privatix.Agent - cross-platform software for exit nodes owners

This product is one of the two most important foundations of the entire Privatix Network, since it allows you to route traffic and sell internet bandwidth to the network.

The first versions for such popular platforms as Windows, Ubuntu, Android, MacOS, iOS will be developed.

9.3 Q3 - Q4 / 2018 : Proof of Concept (PoC) products and Network

For two quarters, further development of the Privatix Network will be conducted taking into account feedback from the community. At the end of that period, the Beta release of the network will be made, which in essence will be a fully working version.

At the same time, on the basis of the Alpha version of the network, the development of products based on the network will begin; these products will ensure there is adequate demand for broadband. We hope to reduce development time through partnerships or the creation of specialized individual teams and business units in the company.

Deadline: The fourth quarter of 2018

9.3.1 Consumer VPN, based on DPI-free VPN protocol

In the development of standard VPN services we have no competitors. However, we are dealing with VPN on blockchain with a completely different level of development. VPN applications will be developed for all popular operating systems and platforms for maximum market coverage.

9.3.2 Advanced Proxy / Socks selling API platform

A unique platform on which it is possible to use the API to buy multiple outgoing residential IP addresses and their associated spare internet broadband. We expect that this product will allow us to create a huge demand for traffic on the network and therefore we have made it one of our priorities.

9.3.3 Privatix Network - Beta release

The second (Beta) release of the network will be a fully working Network but with some centralized elements. These elements will be fully transferred to the blockchain with the final release of the network in the next stage.

9.4 Q1 - Q2 / 2019 : Additional Proof of Concept (PoC) products and Network

At the beginning of 2019 our company will already have a fully working Network, so the work that will be conducted in the first two quarters of 2019 will relate to its final release and the transfer of all elements to the blockchain. Also in the first two quarters of 2019, two more products will be created based on the Network.

Deadline for release: The second quarter of 2019

Note: This stage will be implemented if the maximum goal (hard cap) is reached.

9.4.1 Privatix Network - Final release

The final release of the network means that from then on it becomes completely autonomous and any developer can use it to create their own products.

9.4.2 Privatix.FAAS (SDK)

A product that removes the need for developers to worry that their application will be blocked from any source, whether by a local firewall at the ISP level or a global block at governmental level.

9.4.3 Privatix.Monetize (SDK)

This product will allow developers to earn more on their applications and programs. By installing our SDK, the developer will be able to monetize a portion of users' spare bandwidth.

9.5 Q3 - Q4 / 2019 : Proof of Concept (PoC) products and Network

In the second half of 2019, having already a working and autonomous Privatix Network, we will be able to develop additional products based on it, which will increase the number of participants and, accordingly, the demand for the token itself.

Deadline for releases: end of 2019.

Note: This stage will be implemented if the maximum goal (hard cap) is reached.

9.5.1 Privatix.BOX (Hardware)

A physical device that allows you to simultaneously become an Agent of a Privatix Network and also use VPN functions as a Network Client. This device can also be used as a secure Wi-Fi router.

9.5.2 Infrastructure for VPN providers

We plan to create a product in the form of a network-based service and essentially resell the broadband to existing VPN providers. They will be able to use the traffic from the Privatix Network instead of buying it from internet hosts, and thereby save costs without losing quality.

10. Additional information

10.1 Legal protection framework for exit nodes owners

We will develop a legal framework to help exit node owners (Agents) to handle situations when they are accused of improper activity by someone who used their node (IP address) .

The basic concept behind this proposal is that certain responsibilities will be transferred from Agents to our company. We will provide to all Agents a document stating that we as a company lease their network for our use and resell it. This document will contain the Agent's node IP and hash in blockchain and the Agent will be able to download it from his dashboard.

For example, in the event an exit node was compromised by criminal activity and police make an investigation, the Agent can print the document and give it to the investigators. Based on node hash and timestamps, the investigators can find on open blockchain related and relevant information, and also contact us and make request for additional data.

We will also try to provide legal help and assistance to investigators and compromised Agents in serious cases at our cost. We will take out some insurance as well; insurance that we can extend to all our Agents in future to cover these types of expenses, should the need arise.

Anonymity is the basis of our network. Of course it has certain risks, but in response to these risks we are going to free Agents from legal responsibility rather than stake out every user.

10.2 Solution for mass adoption problem

As advocates of blockchain principles and a decentralized economy, we certainly support the idea that all payments need to be executed internally with our tokens inside our crypto-economy. Even though this is our paramount goal, we understand that it would make it quite difficult to achieve mass adoption and tempt Agents. At this time, only a fraction of people understand the crypto-economy concept and we don't have time to wait for the entire internet to climb on board; that could take years.

In order to grow as fast as possible within these limitations, we will develop a centralized exchange gateway to the Privatix crypto-economy in order to create a bigger supply of spare broadband and multiply the number of Agents quickly. Thus, not just users that are familiar with the crypto-world will be able to be an Agent and profit from spare broadband, but all regular internet users as well.

These Agents will see the PRIX token as internal currency and the instant value of these tokens in fiat currency at the same time. For example, if an Agent accumulated the equivalent of “100” in some fiat currency and demanded to be paid, we would provide a simple mechanism to withdraw this token through exchange to fiat and pay him using a common payment system.

10.3 Commitment to open source community

Our team strongly believe in open source and make a promise after three years to contribute 5% from Privatix profits to the development of important open source projects.

10.4 Legal disclaimers

THIS DOCUMENT DOES NOT CONSTITUTE AN OFFER TO SELL, AN INVITATION TO INDUCE AN OFFER, OR A SOLICITATION OF AN OFFER TO ACQUIRE SECURITIES.

THIS DOCUMENT IS PROVIDED FOR INFORMATIONAL PURPOSES ONLY AND DOES NOT CONSTITUTE INVESTMENT ADVICE.

OUR WHITE PAPER MAY CONTAIN ‘FORWARD-LOOKING STATEMENTS’ - THAT IS, STATEMENTS RELATED TO FUTURE, NOT PAST, EVENTS. IN THIS CONTEXT, FORWARD-LOOKING STATEMENTS OFTEN ADDRESS OUR EXPECTED FUTURE BUSINESS AND ORGANIZATIONAL PLANS, THE PERFORMANCE, AND DEVELOPMENT OF THE PRIVATIX PLATFORM INTEGRATED WITH BLOCKCHAIN,

AND OFTEN CONTAIN WORDS SUCH AS 'EXPECT', 'ANTICIPATE', 'INTEND', 'PLAN', 'WILL', 'WOULD', 'ESTIMATE', 'FORECAST' OR 'TARGET'. SUCH FORWARD-LOOKING STATEMENTS BY THEIR NATURE ADDRESS MATTERS THAT ARE, TO DIFFERENT DEGREES, UNCERTAIN. WE CANNOT GUARANTEE THAT ANY FORWARD LOOKING STATEMENTS, BACKTESTS OR EXPERIMENTS MADE BY US OR EXPECTED RESULTS OF OPERATION OF THE PRIVATIX PLATFORM WILL CORRELATE WITH THE ACTUAL FUTURE FACTS OR RESULTS.

ALL POTENTIAL RISKS CAN BE ASSESSED HERE
<https://dxw4crzwfgmzw.cloudfront.net/site/risk-factors.pdf>

THE SALE OF PRIX TOKENS CONSTITUTES THE SALE OF A LEGAL SOFTWARE PRODUCT UNDER GIBRALTAR LAW. THIS PRODUCT SALE IS CONDUCTED BY PRIVATIX TOKEN LIMITED, A GIBRALTAR LIMITED COMPANY, OPERATING UNDER GIBRALTAR LAW. IT IS THE RESPONSIBILITY OF EACH POTENTIAL PURCHASER OF PRIX TOKENS TO DETERMINE IF THE PURCHASER CAN LEGALLY PURCHASE PRIX TOKENS IN THE PURCHASER'S JURISDICTION AND WHETHER THE PURCHASER CAN THEN RESELL THE PRIX TOKENS TO ANOTHER PURCHASER IN ANY GIVEN JURISDICTION.

To be used if the White Paper and other documents will be available in multiple languages:

FOR THE CONVENIENCE OF OUR USERS, THE PRIVATIX WHITE PAPER, WEBSITE AND OTHER RELATED DOCUMENTS ARE AVAILABLE IN A NUMBER OF LANGUAGES. IN THE EVENT THERE IS ANY CONFLICT BETWEEN THE ENGLISH LANGUAGE VERSION AND A FOREIGN LANGUAGE VERSION, THE ENGLISH LANGUAGE VERSION SHALL GOVERN.

10.5 RISK FACTORS

You should carefully consider and evaluate each of the following risk factors and all other information contained in the Terms of Token Sale (the “Terms”) before deciding to participate in the Privatix Token Sale (“Token Sale”). To the best of Privatix Token Ltd.’s (the “Company”) knowledge and belief, all risk factors which are material to you in making an informed decision to participate in the Token Sale have been set out below. If any of the following considerations, uncertainties or material risks develops into actual events, the business, financial position and/or results of operations of the Company and the maintenance and level of usage of the Privatix platform and the Privatix Tokens (“PRIX”) could be materially and adversely affected. In such cases, the trading price of PRIX Tokens (in the case where they are listed on a cryptocurrency exchange) could decline due to any of these considerations, uncertainties or material risks, and you may lose all or part of your PRIX Tokens.

RISKS RELATING TO PARTICIPATION IN THE TOKEN SALE

There is no prior market for PRIX Tokens and the Token Sale may not result in an active or liquid market for the PRIX Tokens

Prior to the Token Sale, there has been no public market for the PRIX Tokens. Although the Company will use reasonable endeavors to seek the approval for availability of the PRIX Tokens for trading on a cryptocurrency exchange, there is no assurance that such approval will be obtained. Furthermore, even if such approval is granted by a cryptocurrency exchange, there is no assurance that an active or liquid trading market for the PRIX Tokens will develop or if developed, be sustained after the PRIX Tokens have been made available for trading on such cryptocurrency exchange. There is also no assurance that the market price of the PRIX Tokens will not decline below the original purchase price (the “Purchase Price”). The Purchase Price may not be indicative of the market price of the PRIX Tokens after they have been made available for trading on a cryptocurrency exchange.

A PRIX Token is not a currency issued by any central bank or national, supra-national or quasi-national organization, nor is it backed by any hard assets or other credit. The Company is

not responsible for nor does it pursue the circulation and trading of PRIX Tokens on the market. Trading of PRIX Tokens will merely depend on the consensus on its value between the relevant market participants, and no one is obliged to purchase any PRIX Token from any holder of the PRIX Token, including the purchasers, nor does anyone guarantee the liquidity or market price of PRIX Tokens to any extent at any time.

Furthermore, PRIX Tokens may not be resold to purchasers who are citizens or permanent residents of, People's Republic of China, Republic of Korea (including its territories and possessions) or any other jurisdiction where the purchase of PRIX Tokens may be in violation of applicable laws. Accordingly, the Company cannot ensure that there will be any demand or market for PRIX Tokens, or that the Purchase Price is indicative of the market price of PRIX Tokens after they have been made available for trading on a cryptocurrency exchange.

Future sales or issuance of the PRIX Tokens could materially and adversely affect the market price of PRIX Tokens

Any future sale or issuance of the PRIX Tokens would increase the supply of PRIX Tokens in the market and this may result in a downward price pressure on the PRIX Token. The sale or distribution of a significant number of PRIX Tokens outside of the Token Sale (including but not limited to the sales of PRIX Tokens undertaken after the completion of the initial token sale, issuance of PRIX Tokens to persons other than purchasers for purposes of community and employee initiatives, affiliate (or bounty) program development, academic research, education and market expansion and issuance of PRIX Tokens as a reward to employees and/or users of the Privatix platform), or the mere perception that such further sales or issuance may occur, could adversely affect the trading price of the PRIX Tokens.

Negative publicity may materially and adversely affect the price of the PRIX Tokens

Negative publicity involving the Company, the Privatix platform, the PRIX Tokens or any of the key personnel of the Company, may materially and adversely affect the market perception or market price of the PRIX Tokens, whether or not it is justified.

We may not be able to pay any anticipated rewards in the future

There is no assurance that there will be any transaction volume such that you will receive any rewards anticipated to be distributed to active users of the Privatix platform. Further, even in the

event there is substantial transaction volume and interactions among the users and the Privatix platform, there is no assurance you personally will receive any part of the rewards. This is because the ability of the Company to pay any reward to you will depend on the future results of operations and the future business and financial condition of the Company and there is no assurance of the future results of operations and the future business and financial condition of the Company.

There is no assurance of any success of Privatix Platform or any Future Business Line

The value of, and demand for, the PRIX Tokens hinges heavily on the performance of the Privatix platform. There is no assurance that the Privatix platform will gain traction after its launch and achieve any commercial success. Although the Company has performed some testing, including QA-testing of the Privatix platform with relatively positive results, the Privatix platform has not been fully developed and finalized and is subject to further changes, updates and adjustments prior to its launch. Such changes may result in unexpected and unforeseen effects on its projected appeal to users, possibly due to the failure to meet users' preconceived expectations based on the beta version, and hence impact its success. Limited usage of the Privatix platform and potential lack of trust for its crowdsourced predictive accuracy would impact the public demand for the PRIX Tokens and correspondingly the trading price of the PRIX Tokens.

The trading price of the PRIX Tokens may fluctuate following the Token Generation Event

The prices of cryptographic tokens in general tend to be relatively volatile, and can fluctuate significantly over short periods of time. The demand for, and corresponding the market price of, the PRIX Tokens may fluctuate significantly and rapidly in response to, among others, the following factors, some of which are beyond the control of the Company:

- (a) new technical innovations;
- (b) analysts' speculations, recommendations, perceptions or estimates of the PRIX Token's market price or the Company's financial and business performance;
- (c) changes in market valuations and token prices of entities with businesses similar to that of the Company that may be listed on the same cryptocurrency exchanges as the PRIX Tokens;

- (d) announcements by the Company of significant events, for example partnerships, sponsorships, new product developments;
- (e) fluctuations in market prices and trading volume of cryptocurrencies on cryptocurrency exchanges;
- (f) additions or departures of key personnel of the Company;
- (h) success or failure of the Company's management in implementing business, development and growth strategies;
- (i) changes in conditions affecting the blockchain or sport technology industry, the general economic conditions or market sentiments, or other events or factors.

The funds raised in the Token Sale are exposed to risks of theft

Further, upon receipt of the funds, the Company will make every effort to ensure that the funds received will be securely held through the implementation of security measures. Notwithstanding such security measures, there is no assurance that there will be no theft of the cryptocurrencies as a result of hacks, sophisticated cyber-attacks, distributed denials of service or errors, vulnerabilities or defects on the Token Sale website, in the smart contract(s), if used, on which the escrow wallet and the Token Sale may rely, on the Ethereum or any other blockchain, or otherwise. Such events may include, for example, flaws in programming or source code leading to exploitation or abuse thereof. In such event, even if the Token Sale is completed, the Company may not be able to receive the cryptocurrencies raised and may not be able to use such funds for the development of the Privatix platform and/or for launching the Privatix platform, including but not limited to the structuring and through developing of the Privatix peer-to-peer bandwidth marketplace. In such case, the launch of the Privatix platform might be temporarily or permanently curtailed. As such, distributed PRIX Tokens may hold little worth or value, and this would impact its trading price.

RISKS RELATING TO PRIVATIX TOKEN LIMITED.

The Privatix platform is developed, operated and maintained by Privatix Token Limited. Any events or circumstances which adversely affect Privatix Token Limited or any of its successor operating entities (collectively referred to herein as "Privatix Token Limited") may have a

corresponding adverse effect on the Privatix platform. Such adverse effects would correspondingly have an impact on the utility, liquidity, and the trading price of the PRIX Tokens.

Privatix Token Limited may be materially and adversely affected if it fails to effectively manage its operations as its business develops and evolves, which would have a direct impact on its ability to maintain the Privatix platform. The sport media technology and cryptocurrency industries, and the markets in which Privatix Token Limited competes have grown rapidly over the past years and continue to evolve in response to new technological advances, changing business models and other factors. As a result of this constantly changing environment, Privatix Token Limited may face operational difficulties in adjusting to the changes, and the sustainability of Privatix Token Limited will depend on its ability to manage its operations and ensure that it hires qualified and competent employees, and provides proper training for its personnel. As its business evolves, Privatix Token Limited must also expand and adapt its operational infrastructure. Privatix Token Limited's business relies on its blockchain-based software systems, cryptocurrency wallets or other related token storage mechanisms, blockchain technology and smart contract technology, if used, and on machine learning and artificial intelligence platforms. All of these systems and tools represent complex, costly, and rapidly changing technical infrastructure. In order to demonstrate continued ability to effectively manage technical support infrastructure for the Privatix platform, Privatix Token Limited will need to continue to upgrade and improve its data systems and other operational systems, procedures and controls. These upgrades and improvements will require a dedication of resources, are likely to be complex and increasingly rely on hosted computer services from third parties that Privatix Token Limited does not control. If Privatix Token Limited is unable to adapt its systems and organization in a timely, efficient and cost-effective manner to accommodate changing circumstances, its business, financial condition and results of operations may be adversely affected. If the third parties whom Privatix Token Limited relies on are subject to a security breach or otherwise suffer disruptions that impact the services Privatix Token Limited uses, the integrity and availability of its internal information could be compromised, which may consequently cause the loss of confidential or proprietary information, and economic loss. The

loss of financial, labor or other resources, and any other adverse effect on Privatix Token Limited's business, financial condition and operations, would have a direct adverse effect on Privatix Token Limited's ability to maintain the Privatix platform. Any adverse effects affecting Privatix Token Limited's business or technology are likely to also adversely impact the utility, liquidity, and trading price of the PRIX Tokens.

Privatix Token Limited may experience system failures, unplanned interruptions in its network or services, hardware or software defects, security breaches or other causes that could adversely affect Privatix Token Limited's infrastructure network, and/or the Privatix platform.

Privatix Token Limited is not able to anticipate when there would be occurrences of hacks, cyber- attacks, distributed denials of service or errors, vulnerabilities or defects in the Privatix platform, in the smart contracts, if used, or on the Ethereum or any other blockchain technology. Such events may include, for example, flaws in programming or source code leading to exploitation or abuse thereof. Privatix Token Limited may not be able to detect such hacks, cyber-attacks, distributed denials of service errors vulnerabilities or defects in a timely manner, and may not have sufficient resources to efficiently cope with multiple service incidents happening simultaneously or in rapid succession.

Privatix Token Limited's network or services, which would include the Privatix platform, could be disrupted by numerous events, including natural disasters, equipment breakdown, network connectivity downtime, power losses, or even intentional disruptions of its services, such as disruptions caused by software viruses or attacks by unauthorized users, some of which are beyond Privatix Token Limited's control. Although Privatix Token Limited has taken steps against malicious attacks on its platform or its infrastructure, which are critical for the maintenance of the Privatix platform, there can be no assurance that cyber-attacks, such as distributed denials of service, will not be attempted in the future, that Company's enhanced security measures will be effective. Privatix Token Limited may be prone to attacks on its infrastructure intended to steal information about its technology, financial data or user information or take other actions that would be damaging to the Company and/or holders of the PRIX Tokens. Any significant breach of the Company's security measures or other disruptions

resulting in a compromise of the usability, stability and security of the Privatix platform may adversely affect the utility, liquidity and/or trading price of the PRIX Tokens.

We are dependent in part on the location and data center facilities of third parties

Privatix Token Limited's current infrastructure network is in part established through servers which it owns and houses at the location facilities of third parties, and servers that it rents at data center facilities of third parties. If the Company is unable to renew its data facility lease on commercially reasonable terms or at all, Privatix Token Limited may be required to transfer its servers to a new data center facility, and may incur significant costs and possible service interruption in connection with the relocation. These facilities are also vulnerable to damage or interruption from, among others, natural disasters, arson, terrorist attacks, power losses, and telecommunication failures. Additionally, the third party providers of such facilities may suffer a breach of security as a result of third party action, employee error, malfeasance or otherwise, and a third party may obtain unauthorized access to the data in such servers. As techniques used to obtain unauthorized access to, or to sabotage systems change frequently and generally are not recognized until launched against a target, Privatix Token Limited and the providers of such facilities may be unable to anticipate these techniques or to implement adequate preventive measures. Any such security breaches or damages which occur which impact upon the Company's infrastructure network and/or the Privatix platform may adversely impact the utility, liquidity, and/or trading price of the PRIX Tokens.

General global market and economic conditions may have an adverse impact on Privatix Token Limited operating performance, results of operations and cash flows

Privatix Token Limited has been and could continue to be affected by general global economic and market conditions. Challenging economic conditions worldwide have from time to time, contributed, and may continue to contribute, to slowdowns in the information technology industry at large. Weakness in the economy could have a negative effect on the Company's business, operations and financial condition, including decreases in revenue and operating cash flows, and inability to attract future equity and/or debt financing on commercially reasonable terms. Additionally, in a down-cycle economic environment, Privatix Token Limited may experience the negative effects of a slowdown in trading and usage of the Privatix platform.

Suppliers on which Privatix Token Limited relies for servers, bandwidth, location and other services could also be negatively impacted by economic conditions that, in turn, could have a negative impact on the Company's operations or expenses. There can be no assurance, therefore, that current economic conditions or worsening economic conditions or a prolonged or recurring recession will not have a significant adverse impact on Privatix Token Limited's business, financial condition and results of operations and hence the Privatix platform. Any such circumstances would then correspondingly negatively impact the utility, liquidity, and/or trading price of the PRIX Tokens.

The Company or the PRIX Tokens may be affected by newly implemented regulations

Cryptocurrency trading and token sales are generally unregulated worldwide, but numerous regulatory authorities across jurisdictions have been outspoken about considering the implementation of regulatory regimes which govern cryptocurrency or cryptocurrency markets. The Company or the PRIX Tokens may be affected by newly implemented regulations relating to cryptocurrencies or cryptocurrency markets, including having to take measures to comply with such regulations, or having to deal with queries, notices, requests or enforcement actions by regulatory authorities, which may come at a substantial cost and may also require substantial modifications to the Privatix platform. This may impact the appeal of the Privatix platform for users and result in decreased usage of the Privatix platform and the PRIX Tokens. Further, should the costs (financial or otherwise) of complying with such newly implemented regulations exceed a certain threshold, maintaining the Privatix platform may no longer be commercially viable and the Company may opt to discontinue the Privatix platform and/or the PRIX Tokens. Further, it is difficult to predict how or whether governments or regulatory authorities may implement any changes to laws and regulations affecting distributed ledger technology and its applications, including the Privatix platform and the PRIX Tokens. Privatix Token Limited may also have to cease operations in a jurisdiction that makes it illegal to operate in such jurisdiction, or make it commercially unviable or undesirable to obtain the necessary regulatory approval(s) or license(s) to operate in such jurisdiction. In scenarios such as the foregoing, the utility, liquidating, and/or trading price of PRIX Tokens will be adversely affected or PRIX Tokens may cease to be traded.

There may be unanticipated risks arising from the PRIX Tokens

Cryptographic tokens such as the PRIX Tokens are a relatively new and dynamic technology. In addition to the risks included in the above discussion of Risk Factors, there are other risks associated with your purchase, holding and use of the PRIX Tokens, including those that Privatix Token Limited cannot anticipate. Such risks may further appear as unanticipated variations or combinations of the risks discussed above.
